The early history of stereophony is bound up with the fact that typical headphones have two earpieces each of which can supply sound signals to its ear independently of the other. Two microphones in the positions normally occupied by the ears two signal channels and the two ear pieces give a very satisfactory sensation of sound location and the system is named a binaural one.

If however loudspeaker facilities are required and for reasons of personal if not social convenience they usually are it is necessary to generate stereophonic signals by means more technically sophisticated. This is certainly true if the number of channels is more than two to be excessive and there are good commercial reasons why the number of channels is restricted to two.

The fundamental work on the processing of signals to yield two channel stereophony was done by the late A. D. Blumlein of EMI Ltd. His original patent being dated 1931. The fertility and soundness of his ideas were stunted by the limitations of contemporary pick ups and discs they had to wait on the development of the magnetic tape and the 1 p disc. These having been achieved stereophonic tapes and discs appeared from 1955 onwards. Stereo discs surviving some very crude attempts emanating from the U.S.A. are now at their best superb.

However the stereo signals are processed in the recording studio and there is more than one thought on this matter what is eventually applied to the two channel recording machine is a pair of signals designated as L and R for Left and Right respectively. These two signals separately modulate a single groove by causing the stylus simultaneously to cut what is in effect both a hill and dale recording and a lateral recording. The stylus is acted upon by two transducing elements at right angles so that its vibration is partly vertical and partly lateral. It would seem simplest to make the vertical and lateral recordings carry separately the L and R signals. For a number of technical reasons this is not done. The transducers mutually at right angles are each inclined at 45° to the record surface so that the groove walls also inclined at 45° separately receive the L and R information. Replay with an element which is purely lateral responsive i.e. a monophonic pick up therefore generates a mixed (L + R) signal. The mode is called 45/45 recording.

On replay the stereo pick up stylus performs a similar compound vibration, and its two transducers similarly at right angles resolve the motion such that the L and R signals re-appear at the pick ups as two pairs of output terminals. Thereafter the L and R are amplified in identical

channels before application to a pair of loud speaker systems. The designed for differences in arrival times and intensities of the two signals can then give a subjective effect of sound distribution valid over a reasonable area in front of the loudspeakers.

Tomorrow

The superiority of the modern lp over the original Berliner records is very clear in respect of every important performance criterion. The scratchy sub-telephone quality of the early discs has to be compared with the noise-free stereophonic sound of the best of the lps extending as it does over the whole of the audible spectrum and of quality limited chiefly by the capability of the replay equipment. Is there room for improvement? Does there remain to be heralded another major innovation in the development of the gramophone record?

To prophesy accurately in such matters demands genius or luck. However it is to be noted that the technical performance of the contemporary disc leaves little room for improvement. It is true that the technique of tracing a pre-cut groove with a stylus carries certain intrinsic distortions with it, all of which introduce spurious harmonic and inharmonic tones not present in the original performance and one recent development has been the introduction during recording of a kind of inverse distortion which on replay tends to cancel out the replay distortion. But this is refinement not a major innovation.

Similarly there is always the quest for increased playing time without sacrifice of quality. It is difficult to see its achievement with the traditional disc recording medium in view of the extreme delicacy of pick-up necessary to achieve the prevailing standards of quality at the prevailing record speeds.

It might be felt that a major change could be made—downwards—in the price of records by some novel production-engineering venture. Yet of the components of the selling price the production cost is less sometimes much less than the sum of the other costs all of which are unrelated to the recording medium: artists' fees, royalties, publicity tax and so on.

The truth is probably that the disc record has nearly reached the end of its technical exploitability and that it is susceptible to improvements in detail only. The disc has survived competition from other media, notably the magnetic tape, because of its convenience of use in the domestic environment and because it is supported by a massive and long-established production effort dealing with a similarly large and established repertoire. In short both manufacturers and the general public know and accept the gramophone record. Other days bring other ways, though. The disc will survive for many years, but not as the medium of the future: the latter may already exist as the coated plastic tape—or it may await invention.

Appendix

Some Explanations of Terminology

The better to appreciate the problem of sound recording, consider the nature of the sound itself. The ear responds to sound (i.e. it gives the sensation of hearing) by a complicated mechanism which is imperfectly understood but which certainly originates in the vibration of a diaphragm. This is the ear drum which is a thin membrane of cartilage completely closing the entrance to the middle ear and to other parts of the hearing system further within the skull. The motion of the ear drum is conveyed by a linkage of three small bones the ossicles to the inner ear where a conversion is made from mechanical vibration to nervous signals which are transmitted to the brain. See also Q12-13.

Pitch.

Vibration of the ear drum results from vibration or periodic alternation, of air pressure. Hence the source of sound must itself set up air

pressure variations. Moreover if the sound is to be audible and by definition it must be so the pressure variations must not occur too slowly—the comparatively slow change of pressure with change of altitude for example causes a sensation not of sound but of ear blockage. Nor must the variations be too rapid—the inaudible dog whistle sets up air pressure variations which are too frequent to be heard by the human ear and we enter the realm of ultrasonics (L118). The rate at which the pressure variations recur called the frequency is the physical concomitant of the pitch of the sound.

It transpires that the person with average hearing can sense variations occurring not less frequently than about 20 per second and not more frequently than about 15 000 per second although age and state of health have something to do with the exact range of audible frequencies.

So a requirement of the ideal sound recording system is that it shall respond to air pressure fluctuations within the range 20-15 000 Hz (cycles or complete fluctuations per second). (With pressure changes there are associated velocity changes and some recording systems are velocity responsive rather than pressure responsive. This does not alter the tenor of what is said here about frequency range etc.)

Loudness.

If it is to simulate the ear in order that it can later reproduce the sound for the benefit of another ear the recording system must also cater for the range of loudnesses which the average ear will accept. This range is very large indeed for the greatest loudness an ear can tolerate without actual pain or damage is set up by a pressure variation at the ear of a magnitude which is perhaps 10 million times the pressure magnitude corresponding to a sound which is barely audible.

This gives a measure of what is often referred to as the dynamic range of the recording system. The dynamic range is the difference between the loudest or highest level sound which the system can handle without malfunction and the smallest signal which it can handle.

Noise

The question of the very small signals that represent the very quiet sounds arises because of a third important factor which has to be taken into account: this is the residual noise level. A certain level of noise and hum exists inescapably within the recording system and because sounds which are quiet enough to lie just above below or at the noise level are in practice the smallest that can usefully be handled the dynamic range is reckoned with the noise level as its lower limit.

Distortion

We are deriving some of the most important features by means of which recording systems can be judged and in addition to the three referred to above (frequency range, dynamic range and noise level) there is one other. It is non-linearity distortion. This is a general name given to any imperfection of the system which degrades the way in which the system responds to sounds of various loudnesses. For example if the reproduced sound doubles in loudness does the reproduced sound do likewise? If so there is no non-linearity distortion present. On the other hand if the reproduced sound does not change in exact proportion to the original non-linearity distortion exists. The ear is not very tolerant of the effects of non-linearity which shows itself in the production of spurious sounds which were not present in the original. These spurious signals may be overtones or harmonics of components of the original (these called harmonic distortion) or they may be inharmonic signals (inter-modulation distortion) which grate even more offensively on the listener's ear. An everyday example of non-linearity distortion at work is the public telephone service: the reproduction at the telephone earpiece is distorted very badly by comparison with the original speech or indeed by comparison with a reproduced sound of high quality such as that from a good v.h.f. receiver tuned to a BBC v.h.f. broadcast.

* In the cases of these elements which are very rare or not found in nature but have been artificially prepared atomic weight in the chemical sense is meaningless the integral mass of the most stable isotope known is given.

Note. In 1961 the isotope of Carbon 12 replaced Oxygen as a standard the weight of its atom being taken as exactly 12. This change of standard has meant a slight adjustment in atomic weights from the old chemical scale.

The new elements with an atomic number higher than that of uranium 238 (element 92) are termed Transuramics.

GAS LAWS

Boyle's Law (1662) $pV = \text{constant}$

Charles Law (1787) $\frac{pV}{T} = \text{constant}$

Van der Waals equation $\left(p + \frac{a}{V^2}\right)(V - b) = RT$ where a and b are constants.

Adiabatic expansion of a gas $pV^\gamma = \text{constant}$ where $\gamma = \frac{C_p}{C_v}$

BACKGROUND TO ECONOMIC EVENTS

The aim of this section is to help the ordinary reader to follow economic events as they happen, and to understand the controversies that accompany them

BACKGROUND TO ECONOMIC EVENTS

This section is divided into four parts. Part I gives a brief description of the most important problems of economic policy. Part II is concerned with a more detailed survey of the British economy and the way in which it operates. In the course of this survey the specialised terms used by economists are explained and the attempt is made to present an intelligible summary of the information facts and figures relevant to an understanding of economic events. There are five main sub-sections: International Trade and Payments, Production, Employment and Industry, Incomes, Wages and Prices, Money, Banking and Finance and Economic Aspects of the Public Services. Part III outlines the main economic problems faced by the underdeveloped countries and the economic policies of Britain and other developed countries towards the underdeveloped world. Some suggestions for further reading are given at the end of Parts II and III. Part IV is written as shortly before publication as possible and contains a survey of developments in the British economy since 1960.

I CENTRAL PROBLEMS OF ECONOMIC POLICY

Unemployment

Between the wars unemployment was Britain's most urgent economic problem. The level of unemployment varied with the ups and downs of the trade cycle. Quite the worst slump was that of the early 1930s: in 1932 nearly 3 million workers were without a job. But unemployment remained high even in the best years and in no year between 1919 and 1939 were there fewer than a million workers unemployed. Economists make a distinction between *structural* unemployment and *cyclical* unemployment. Structural unemployment appears when the structure of industry gets out of line with the pattern of demand for industrial products. In Britain unemployment was particularly severe and persistent in areas which were dependent on the coal, textile and shipbuilding industries and some sections of the engineering industry. These industries had been in the forefront of Britain's industrial growth in the 19th century and had contributed greatly to the expansion of exports. In areas like South Wales, Tyneside, Clydeside and Northern Ireland there was little alternative work for those no longer needed in the staple industries; new industries were being built up in the inter-war period but they tended to be located in the relatively prosperous Midlands and South East England. Cyclical unemployment appears when there is a general decline in the level of demand for goods and services which leads to a decline in the employment of workers producing those goods and services. In the slump years unemployment was so high because of a combination of structural and cyclical unemployment; in the best years unemployment was largely structural.

Unemployment means waste. Men willing to work who could produce valuable goods and services are idle; the economy produces fewer goods and services than it is capable of producing. Unemployment also means hardship and low standards of living for those out of work and for their families.

The avoidance of mass unemployment has been accepted as a primary objective of economic policy by all political parties and there is a wide measure of agreement on the policies which must be applied to ensure that unemployment on the scale of the 1930s never occurs again. Cyclical unemployment has to be tackled by measures to increase total demand and total spending by consumers by investors and by the Government. Structural unemployment has to be tackled by inducing new industries to move into areas where other employment is declining or by inducing labour to move from those areas to areas where there is a demand for its services.

There have been ups and downs in unemployment in the post-war years but these have been very slight compared to those of the pre-war years. In most post-war years less than 2 per cent of the working population was unemployed—a sharp contrast with the 11 per cent for 1937 and the 22 per cent for 1932. But there are still

areas of the country where structural unemployment is serious. In Northern Ireland, for example, despite the efforts which have been made to attract new industries, unemployment ranged between 6 and 10 per cent in the last decade.

Inflation

A characteristic of the British economy in post-war years has been a persistent rise in prices and money incomes. For example, between 1959 and 1969 retail prices went up by about 41 per cent or—expressed as an annual rate—by 3.5 per cent per annum; export prices rose by 30 per cent (or 2.7 per cent per annum) and weekly wage rates by about 52 per cent (4.3 per cent per annum). However, these rates of increase were somewhat slower than the corresponding rates in the immediate post-war decade. This inflation of prices and money incomes is considered undesirable for two main reasons. Firstly, it is associated with an arbitrary redistribution of purchasing power. Prices rise for everyone but some members of the community are better placed than others to secure increases in their money incomes which offset or more than offset the rise in the price of the goods and services they buy. The feeling that particular groups are falling behind in that their money incomes have not risen as fast as those of other groups is a source of much unrest and discontent. Secondly, and crucially for the British economy, an inflation of prices makes it more difficult to achieve a satisfactory balance of payments. As prices of our exports rise it becomes harder to sell them in foreign markets and as imports become cheap in comparison with goods produced at home there is a tendency to buy more of them.

Two main explanations have been advanced to account for the inflation which has occurred. The first stresses the role of an excess of demand or spending power in the economy—of too much money chasing too few goods and so leading to a rise in prices. The inflationary problem is seen as the obverse of the cyclical unemployment problem: the latter involves a deficiency of spending and the former an excess. Those who consider an excess of demand (*demand pull*) to be an important factor in the inflationary situation favour policies designed to reduce purchasing power—for example, the reduction of spendable income by levying higher taxes, or the reduction of spending financed through borrowing by making credit more expensive or more difficult to get. The second stresses the role of an excessive increase in incomes: it is argued that prices have risen mainly because costs have increased faster than productivity (*cost-push*). Those who take this view favour measures to restrain or control increases in wages, profits, rents and other forms of income. Neither explanation excludes the other. Many would agree that both demand pull and cost push factors have contributed—with different strengths at different times—to the in-

inflationary spiral in prices and incomes and that measures both to control demand and to restrain or control incomes may be necessary.

But it is easier to specify in general terms the measure needed to combat inflation than it is to apply policies which are successful in practice. In particular policy measures to restrain or control wage increases are difficult to reconcile with widely accepted procedures of collective bargaining.

The Balance of Payments

Britain is heavily dependent on imports. This country must import food; it cannot produce enough food within its borders to feed its population. Many of the raw materials necessary for its industry have to be purchased from abroad. Furthermore, some manufactured goods produced in other countries will be purchased because they are cheaper or more attractive than similar goods produced at home. All these goods and our imports of services have to be paid for in foreign currency. Foreign currency is earned by exporting goods and services to other countries. It is not however considered sufficient to earn enough foreign currency from our exports to pay for our imports. The objective is to earn considerably more than that so that we have a surplus of foreign currency available to pay off external debts, to build up our external assets by investing abroad, to enable us to lend and give aid to underdeveloped countries and to increase our foreign exchange resources.

Since the war, our balance of payments position has been precarious. Exports have increased considerably but so have imports and the margin of safety has been so narrow that unfavourable turns of events have led to crises in the balance of payments. In several years our earnings from the export of goods and services have not even been sufficient to cover our payments for imports and in no year has the surplus been as large as is considered necessary. With the balance of payments delicately poised even in favourable years and with corrective action necessary in crisis years, economic policies have been much influenced by our foreign trade problems. It is easy to say that most of the problems would disappear or would become less urgent if we could achieve a major expansion of our exports. But most export markets are highly competitive and we cannot expect to sell more unless the price, quality and terms of delivery of our goods and services are at least as attractive as those of our rivals in export markets.

Economic Growth

Taking a longer view, the most important objective of internal economic policy must be to raise the standard of living. The standard of living can increase only if more goods and services are produced per head of population. In a fully employed economy the main source of increased output is a higher productivity—output per person—of the working population.

Standards of living in this country have been rising: the output of goods and services per head of population increased by about 25 per cent between 1959 and 1969. Nevertheless many economists are of the opinion that the rate of growth of output and productivity can be and

should be increased. In particular they point out that our rate of growth compares unfavourably with that achieved by some other countries. The potentialities for higher productivity are enormous. The U.S.A. has the highest standard of living in the world; in many industries output per person employed is twice or more than that attained in this country. In order to achieve a higher level of productivity in this country more and better machinery and capital equipment will have to be installed; also work will have to be planned, organised and controlled in such a way as to make more effective use of labour and machinery.

Underdeveloped Countries

Britain and the other developed countries of the world have important responsibilities towards the underdeveloped countries. The poorest two thirds of the world's population account for only a sixth of total world income and output while two thirds of world income accrue to the richest sixth of world population, a category which includes Britain. The poorest two thirds suffer from poverty, hunger, malnutrition, debilitating diseases and widespread illiteracy. To make matters worse, most of the poor countries are experiencing a rapid growth of population. Output has to rise as fast as population just to prevent standards of living from falling and an increase in standards of living requires an even faster growth of output.

Few underdeveloped countries can hope to solve the increasing problems they face without active and generous help from developed countries. This help must take many forms. Financial aid in the form of grants or loans in order to place resources at the disposal of underdeveloped countries which they would otherwise not be able to obtain; technical aid to assist in the solution of the many technical problems which have to be solved; trading policies which do not hinder underdeveloped countries from getting the imports they need or from selling their exports—these are all activities in which Britain must play her part. In particular of course, Britain must contribute to the development of the underdeveloped countries of the Commonwealth.

The Inter relationship of Economic Problems

Each of the problems briefly described above is extremely complex. The difficulties of achieving successful solutions are further aggravated by the fact that the problems are interrelated in such a way that measures which are helpful for one problem can make others more difficult to solve. For example, a reduction of purchasing power might be considered helpful in the control of inflation and might ease balance of payments problems by reducing—or slowing down—the increase of imports. But it could also lead to an increase in unemployment and to a slowing down in the rate of growth of the economy. Or again a reduction in aid to underdeveloped countries could make it easier to balance our external accounts but such action could hardly be reconciled with our responsibilities towards underdeveloped countries. In the next section, particular aspects of the British economy are considered in some detail; the final section discusses the main features of the development of the economy since 1960.

II SURVEY OF THE BRITISH ECONOMY

1 INTERNATIONAL TRADE AND PAYMENTS

Imports and Exports

In 1964 the United Kingdom bought from abroad goods to the value of £5,514 million or just over £100 per head. Food is a large item in this bill, accounting for 32 per cent of the total. Fuel, largely oil, costs about 11 per cent, basic materials for industry 31 per cent, and manufactured goods (a category that includes a large number of semi-manufactured goods bought for

further processing) 36 per cent. This last category of imports has increased sharply in recent years. In 1964 they represented only 20 per cent in an import bill of only £3,369 million. All this can be seen in the table.

There are three main determinants of the level of British imports. One is the competitiveness of British with foreign producers. Britain imports those commodities which—at the current exchange rate between the pound and foreign currencies—can be bought more cheaply from foreign than from home producers. Secondly, the level of

imports depends on the extent to which free trade is prevented by tariffs on imported goods or by other devices. Thirdly as total incomes in the economy expand there is a general increase in the demand for goods and services including imports. Therefore imports can be expected to vary directly with the total of incomes in the economy known as the *national income*.

One would expect that the liberalisation of trade since the early 1950s together with a decline in the competitiveness of British producers would have produced an expansion of imports relative to national income. In fact imports as a proportion of national income fell from 23 to 21 per cent between 1954 and 1964. The observed decrease must be explained by the sluggish demand for *primary products* such as food and raw materials. The British spend little of their additional income on imported food and the development of synthetic substitutes and new products has slowed down the growth in demand for raw materials. Moreover since the demand for primary products of this sort has been sluggish on a world scale while supply has increased their price has fallen in relative terms and this too has reduced the total cost of British imports.

--fell or stagnated in world markets over the decade

The Volume of Trade

Superficially it would appear that any improvement in the terms of trade raises the value of British exports relative to imports. However this is not always true. Faster inflation in this country leading to a more rapid increase in export prices would harm rather than help the balance of payments. If the prices of our export goods rise faster than the prices of our competitors in overseas markets it will become progressively more difficult to sell our exports. Conversely an inflation in Britain will make it progressively more attractive to buy goods produced abroad. Thus between 1954 and 1964 the value of imports grew slightly faster than the value of exports despite the slower growth of import prices than of export prices. This was because the volume of imports increased by 61 per cent and the volume of exports by only 40 per cent. The trade balance may well be helped by a fall in the price of imported primary products but the balance of trade

UNITED KINGDOM IMPORTS AND EXPORTS

Imports of goods (c i f)	£ million		Percent w/o of total	
	1954	1964	1954	1964
Food drink and tobacco	1 314	1 773	39	32
Basic materials	1 015	1 119	30	20
Fuels and lubricants	329	585	10	11
Semi manufactures	513	1 173	15	21
Finished manufactures	174	888	5	15
TOTAL*	3 359	5 514	100	100
Exports of goods (f o b)				
Food drink and tobacco	154	283	6	7

Other manufactured goods	490	847	18	20
TOTAL*	2 650	4 254	100	100
Re exports of imports	98	154	—	—

* The column figures do not add up to the totals because the former exclude postal packages

Since the exports of one country must be the imports of another the same factors in reverse foreign competitiveness access to foreign markets and the level of foreign incomes determine the level of British exports. In 1964 these amounted to £4 254 million of which no less than 83 per cent were manufactures mainly of engineering products. Thus Britain gains from trade by exporting manufactures in which she has a *comparative advantage* in return for food and raw materials which she is not suited to produce.

The Terms of Trade.

Between 1954 and 1964 the value of British imports rose by 64 per cent and the value of exports by 61 per cent. These changes can be separated into two components: volume and price. Imports rose in price by only 4 per cent whereas export prices rose by 19 per cent. The ratio of the average price of exports to that of imports is known as the *terms of trade* and a rise in the price of exports relative to imports indicates an improvement in the terms of trade. Thus when we note in the table that the terms of trade improved by 15 per cent between 1954 and 1964 we mean that in 1964 15 per cent less exports by volume would have been needed to buy the same amount of imports as in 1954. This improvement in the terms of trade reflects the fact that the prices of many primary products—food and raw materials such as wheat, cocoa, rubber or copper

in manufactures will be worsened by an improvement in their terms of trade.

VISIBLE TRADE VOLUME AND PRICES

	1961 = 100		Per centage increase 1954-64
	1954	1964	
Value			
Imports	76	125	64
Exports	72	116	61
Volume			
Imports	74	119	61
Exports	80	112	40
Price			
Imports	103	107	4
Exports	89	106	19
Terms of trade	116	99	15

Over the decade there was a persistent fall in Britain's share of world exports from 20.0 per cent of exports of manufactures in 1954 to 13.6 per cent in 1964. Her competitors in export markets—and particularly Germany and Japan—were more successful in expanding their exports. Had the prices of British exports risen less rapidly over this period Britain's share of world exports would have been higher in 1964.

The Balance of Visible Trade

The *balance of (visible) trade* is the difference between exports and imports of goods. It is said to be in *surplus* if exports exceed imports and in *deficit* if imports exceed exports. In estimating the balance of trade it is important that imports and exports be valued on the same basis. The normal method in the trade returns is to measure imports *cif* (cost insurance and freight) and exports *fob* (free on board). In other words import prices are shown to include the costs of transporting them to Britain and exports are valued at the prices when loaded in British ports. Our table shows both imports and exports *fob*.

In no year except 1958 was there a surplus in the British balance of trade. Moreover the deficit was particularly big in certain years: 1951, 1955, 1960 and 1964. The deficit of 1951 was largely due to the Korean war which led to a stockpiling of primary products and a startling increase in their prices. The other three years coincided with booms in the British economy. These were periods of very full employment and high demand which could be met only by increased imports. Moreover there was a building up of raw material stocks which had been depleted during the preceding upswings of the economy.

Invisible Trade and the Current Balance of Payments

The chronic deficit in the balance of visible trade has in normal years been offset by a surplus in the *balance of invisible trade*. This surplus derives from four main groups of transactions. The first covers receipts from non residents *less* payments to non residents for services such as shipping and insurance. The second covers receipts from foreign governments in respect of

together. A deficit with non sterling area countries persisted throughout the 1950s and into the 1960s.

The Long term Capital Account

We have seen that Britain earned a surplus on its current balance of payments in most recent years. Yet it is not sufficient for this country to avoid deficits on its current account. The objective is to earn a substantial surplus in order to finance investment in and lending to other countries—particularly the underdeveloped countries of the Commonwealth—to repay debts to foreign countries which have been incurred and to build up reserves of gold dollars and other currencies which can help to tide us over difficult periods. In fact the objective of the Government was to earn current account surpluses of more than £200 million in normal years and a surplus of this magnitude was only achieved in the exceptionally favourable year 1958.

Between 1954 and 1964 there was a persistent and growing amount of British private investment abroad. Since private foreign investment in Britain also rose the *balance of long term capital transactions* did not show a clear trend. Nevertheless it was generally in deficit to the extent of £100-£200 million. As with current transactions there were considerable regional differences. Usually there was a heavy deficit in long term capital transactions with the sterling area and only minor imbalance with the rest of the world. Thus in 1960 Britain had a deficit with the sterling area of £307 million and a surplus with the rest of the world of £62 million giving an overall deficit on long term capital account of £245 million. The net flow of long term capital to the sterling area neutralised the current account surplus with the sterling area equal to £313 million and this was also the tendency in other years.

CURRENT BALANCE OF PAYMENTS
(£ million)

	1951	1952-54	1955	1956-59	1960	1961-63	1964
Imports (f o b)	3 501	2 958	3 432	3 497	4 137	4 166	5 000
Exports (f o b)	2 752	2 778	3 076	3 366	3 733	4 058	4 471
Balance of visible trade	-749	-180	-356	-131	-404	-108	-529
Balance of invisible trade	330	386	283	255	131	170	122
Current balance of payments	-419	206	-73	124	-273	62	-412

military bases in the country *less* payments by this country in respect of military bases abroad. The third covers receipts of gifts and grants made to this country *less* gifts and grants made by this country. The fourth includes all receipts of interest, dividends and profits earned on overseas investment *less* interest, dividends and profits paid out on foreign investment in this country.

The table shows that in most years the surplus on invisibles exceeded the deficit on visibles so that Britain earned a surplus on the *current balance of payments*. However there was a long run tendency for the surplus on invisibles to decline. Net earnings from shipping services fell and Government military expenditure abroad and grants to other countries increased.

The Current Balance of Payments by Regions

All the figures presented so far refer to Britain's trade with the external world as a whole. These hide a marked pattern of trade. In 1964 just over a third of visible imports and exports came from and went to the countries of the overseas sterling area—comprising the Colonial territories, independent Commonwealth countries other than Canada, British protected states in the Persian Gulf and a few countries such as Burma and South Africa. One reason for Britain's declining share of world trade is that trade within the sterling area has been growing less rapidly than world trade as a whole. Almost 85 per cent of our visible trade was done with Western Europe and rather less than 17 per cent with North America. The current balance of payments surplus found in normal years is generally made up of a large surplus with sterling area currencies partially offset by a deficit with all other countries taken

Monetary Movements

In 1965 Britain had a current account deficit of £104 million and a deficit on long term capital account of £210 million implying a deficit in the *balance of current and long term capital transactions* of £314 million. This balance had to be financed either through an increase in liabilities (for example an increase in the sterling liabilities held by foreigners or in short term loans from the International Monetary Fund) or by a reduction in assets (for example a reduction in the gold and dollar reserves). In fact the gold and foreign currency reserves actually rose in 1965 by £246 million but the sterling balances increased by £55 million and our debts to the International Monetary Fund by no less than £469 million. Total recorded net monetary movements to meet the deficit amounted to only £232 million so that there must have been an unrecorded increase in credit equal to £87 million known as the *balancing item*. Let us consider each of these financing transactions in turn.

The Sterling Balances

Sterling is an international currency and governments and individuals may hold balances in sterling (e.g. Treasury bills, Government stocks and bank accounts) for many reasons. Sterling area countries reckon to keep a high proportion of their international trade reserves in the form of sterling balances. It is convenient to hold sterling to finance trading transactions because sterling is widely acceptable in settlement of trading debts. Sterling balances will also be held to the extent that they are considered a profitable and safe way of holding liquid assets. It may be

profitable to hold sterling if the rate of interest paid on balances in London is higher than that paid in other financial centres. And it may be considered safe to hold sterling if the chances of sterling devaluation (which would automatically reduce the value of the balances in terms of any currency which did not devalue) are thought to be remote.

An increase in the sterling balances enables Britain to finance an adverse balance on current plus long term capital account without reducing the gold and foreign exchange reserves. Conversely a reduction in sterling balances can impose a drain on reserves even if there is no adverse balance on current plus long term capital account.

At the end of 1955 sterling balances held by non residents (excluding the International Monetary Fund) amounted to £3 470 million far in excess of Britain's reserves of gold and convertible currencies equal to £1 070 million. Nearly three quarters of this amount was held by the rest of the sterling area. However it is unlikely that Britain would be able to finance a persistent deficit in her balance of payments through a progressive increase in the sterling balances in the long run the sterling balances will probably be reduced—as indeed they were between 1955 and 1965 by some £200 million. Many under developed countries of the sterling area will want to run down their sterling balances in order to help finance the imports required for their development programmes (see also G33).

Sterling holdings outside the sterling area and particularly the unofficial (i.e. private) holdings are highly volatile in that they may be withdrawn very rapidly if for any reason it is thought less profitable or less safe to hold sterling than some other currency or gold. Since confidence in sterling is weakest (i.e. fear that it will be devalued is greatest) when the balance of payments is in deficit sterling balances tend to move perversely so accentuating movement in the reserves. Such was the case in the sterling crisis at the end of 1964. It is ironical that Britain's position as an international currency country makes it more and not less difficult to rely on a running down of reserves to meet a temporary deficit in the balance of payments.

Foreign Exchange Reserves

The gold and convertible currency reserves are used to finance payments abroad which cannot be financed in any other way. They are a last line of defence in international trade. The reserves held in London belong to the sterling area as a whole and not just to this country. Members of the sterling area are willing to pay into these central reserves some or all of their net earnings of gold and convertible currencies in exchange for sterling balances. They do this on the understanding that they can should they wish to do so call upon the central reserves by exchanging sterling balances for gold and convertible currencies.

The central reserves of gold and foreign currencies amounted to £1 070 million at the end of 1965 a level which though higher than in many previous post war years was felt to be quite inadequate. There are bound to be imbalances in international trade and payments and the function of these reserves is to tide over temporary imbalances by increasing reserves in favourable periods and running down reserves in unfavourable periods. If reserves are not sufficient to withstand temporary pressures measures to protect the reserves will have to be taken—e.g. raising Bank Rate and tightening up monetary policies generally—and these measures may create unemployment and recession and restrict the growth of the economy.

The International Monetary Fund

The *International Monetary Fund* (IMF) was set up after the war with the objective of working towards free trade at stable exchange rates. Under the original agreement setting up the Fund members agreed to make their currencies convertible into other currencies and gold at fixed rates of exchange and agreed not to impose exchange or import controls without the permission of the Fund. Any alteration in the rates of exchange by more than 10 per cent also requires the per-

mission of the Fund. For many years after the war the imbalances in world trade—and particularly the acute shortage of dollars—were such that many countries had to invoke the clauses in the agreement which permitted them to impose restrictions during a transitional period. Although there is still a long way to go before the Fund reaches its objective, considerable progress towards them was made during the 1950s. The progressive relaxation of exchange and import controls by this country was paralleled in some other countries and most of the currencies important in world trade and payments were declared convertible.

The function of the Fund is to make foreign exchange resources available to members who run into balance of payments difficulties. Each member country makes a deposit (called its quota) partly in gold and partly in its own currencies with the Fund. The size of the deposit is fixed in relation to the country's share in world trade. In return it is granted certain automatic drawing rights which entitle it to borrow foreign currencies from the Fund. Furthermore the Fund has power to make larger loans and to grant stand by credits to be drawn on if required. Before the Fund will make such loans and credits available it has to be satisfied that the borrowing country is taking appropriate action to correct the balance of payments disequilibrium.

In 1956 at the time of the Suez crisis there was a running down of sterling balances and Britain negotiated a loan of £202 million from the Fund and an even larger stand by credit. Again in 1964 and 1965 when there was a severe deficit on current and long term capital account and heavy speculation against sterling the Government borrowed from the IMF \$569 million in 1964 and \$499 million in 1965. In this way the country could ride out crises of confidence in sterling without a severe loss of reserves.

Correcting a Deficit

If an imbalance in the current plus long term capital account persists the deficit cannot be met indefinitely from monetary movements. At some stage the Government must take action to remove the deficit. What action can it take? There are a number of alternatives available each with its advantages and disadvantages and economic opinion is by no means unanimous on the choice of policy. Let us consider each of these alternatives in turn.

Variation of the Exchange Rate

The *exchange rate* is the ruling official rate of exchange of pounds for gold and other currencies. It determines the value of British goods in relation to foreign goods. If the pound is devalued in terms of gold and other currencies British exports (which are paid for in pounds) become cheaper to foreigners and British imports (paid for by purchasing foreign currency) become more expensive to holders of pounds. In this way *devaluation* can improve the British balance of payments position by encouraging exports and discouraging imports.

But there are certain disadvantages attached to devaluation. The prospect of devaluation results in a speculative outflow of foreign funds and one devaluation may be taken as a sign that there will be further devaluation in the future. Secondly the sterling area countries—many of them underdeveloped—will suffer a capital loss because they hold their reserves largely in the form of sterling rather than gold (but see G33). Thirdly the rise in the price of imports of raw materials and consumption goods results in higher costs and prices and then in wage demands to maintain the British standard of living. It is possible that inflation will in this way neutralise the beneficial effects of devaluation.

The pound was devalued in 1949 when an official exchange rate of £1 = \$2 8 was established and again in 1967 to a rate of £1 = \$2 4.

Exchange Controls and Convertibility

A currency is *fully convertible* if it can be freely exchanged for any other currency or for gold at the ruling official rates of exchange. Exchange controls impose restrictions on convertibility by

limiting the powers of holder of a currency to exchange their holdings for other currencies or gold at the official rate of exchange. For many years after the war for example there was a world wide shortage of dollars if sterling had been convertible there would have been a rush to convert sterling into dollars with the consequence that the dollar reserves of the sterling area would soon have been exhausted. In fact a premature attempt to establish sterling convertibility in 1947 led to such a drain on reserves that strict exchange controls had to be re imposed.

Exchange controls on residents can be enforced by requiring that earnings of foreign currencies (e.g. the proceeds from the sale of exports) be handed over to the exchange control authority—the Bank of England acts as the Government's agent—in exchange for sterling, and by permitting the exchange of sterling for foreign currencies (e.g. to enable the purchase of imports) only for transactions approved by the exchange control authority. There was a move towards convertibility of sterling during the 1950s and the sterling held by non residents was made fully convertible in 1958. Residents however continued to be subject to exchange controls.

By restricting convertibility the Government can make it more difficult for funds to move into or out of sterling. In this way the Government can impede capital movements e.g. British private investment abroad or flows of short term capital or it can restrict current spending abroad e.g. on foreign holidays.

Import Controls and Tariffs

Import controls impose limitations on the quantity or value of goods which are permitted to enter a country. Tariffs are duties levied on imported goods so that the price of those goods to consumers in a country is higher than the price received by the foreigners supplying the goods. In the early post-war years this country maintained strict import controls over a wide range of goods. These were gradually dismantled until in 1960 the last remaining import controls on goods were abandoned except on habit forming drugs and some agricultural products and textiles from the Far East—to give a measure of protection to British producers.

All countries impose tariffs. Some tariffs are primarily intended to raise revenue for the Government and others are primarily intended to protect home industries by raising the price of competing goods from abroad. The rights of countries to raise tariffs or to operate tariffs in a discriminatory way (i.e. to offer lower tariffs on goods from some sources than on similar goods from other sources) are closely circumscribed by the rules of the *General Agreement on Tariffs and Trade* (GATT). The object of the GATT is to work towards free trade especially through a reduction in tariffs. In the post war period GATT held several major conferences at which bargaining to reduce tariffs was attended by modest success. The most significant moves towards free trade in this period were on a regional basis.

The disadvantage of introducing import controls or tariffs to correct a deficit in the balance of payments is that the benefits of free trade are lost. Moreover there is always the possibility of retaliation by Britain's trading partners. Nevertheless import controls or tariffs may well be preferable to another measure which has been used to correct a deficit—deflation.

Deflation.

Throughout the post-war period the U.K. balance of payments was far from secure. As a result domestic economic policies were much influenced by balance of payments considerations. Devaluation was turned to only as a last resort. The movement in the 1950s and 1960s was towards greater freedom of trade. By ruling out devaluation and trade restrictions, the authorities had to fall back on *deflation* of the economy to correct periodic deficits. In other words the Government took measures to discourage demand and so cut back incomes and employment. By reducing demand in general the authorities secured a fall in demand for imports. However it was necessary to cut back national income by many times

the ensuing fall in imports. Deflation is a painful method of correcting a deficit. Not only does it have a direct effect on the level of incomes and employment but it is also liable to slow down the rate of growth of the economy. This can happen because deflation can weaken the incentive to expand productive capacity by investing in new plant machinery and other capital goods.

The problem which faced British policy makers attempting to raise the rate of economic growth was this: as total demand for goods and services expands it is difficult to prevent growth in the demand for imports and diversion of exports to the home market particularly when home industries reach the limit of their productive capacity. Yet if consequent balance of payments difficulties are met by restrictions on total demand it is difficult to maintain the investment necessary for growth in the productive capacity of the economy. The main need in the late 1960s was the same as that at the start of the 1950s: to achieve an expansion of exports relative to imports so as to secure economic growth without running into balance of payments difficulties.

The international monetary system is partly to blame for the British decisions to resort to periodic deflation of the economy. The use of sterling as a reserve currency has subjected the balance of payments to violent swings in short term capital flows. Moreover a world wide shortage of international liquidity (i.e. gold and foreign exchange reserves) means that countries have an incentive to maintain a surplus in their balance of payments and so increase their reserves. In this situation surplus countries do not help to correct an imbalance in foreign transactions: the burden of correcting the imbalance is placed on the deficit country. If the Government of the deficit country feels itself unable to devalue its currency or to impose trade restrictions it has to deflate the economy. The existing international monetary system contains a deflationary bias which the IMF has at most only ameliorated.

The European Common Market and the European Free Trade Area.

By the end of the 1960s Europe was divided into two major trading groups: the Common Market or *European Economic Community* (EEC) comprising Belgium, France, Holland, Italy, Luxembourg and West Germany and the *European Free Trade Association* (EFTA) comprising Austria, Denmark, Norway, Portugal, Sweden, Switzerland and the United Kingdom.

An account of the negotiations for British entry to the EEC in the 1960s is given in Part IV.

2 EMPLOYMENT, PRODUCTION AND INVESTMENT

Population

In June 1966 the population of the United Kingdom was estimated to be 54.4 million—47.8 million in England and Wales, 5.2 million in Scotland and 1.5 million in Northern Ireland. The total was still rising slowly at a rate of about 0.7 per cent per annum. Prediction of future trends is difficult. Before the war it was common to predict that Britain's population would fall later in the century but these predictions were made at a time when the birth rate was very low. Since then the birth rate has risen sharply and the *net reproduction rate* (the ratio of the birth rate of girls less their infant mortality to the population of women of child bearing age) has been above one in most years since the war. In the near future population will certainly continue to rise slowly as improving medical services raise the average length of life and as the gap between generations shortens.

The Population of Working Age

Of the total population only some are of working age. Working age is defined as the period between the minimum school leaving age of 15 and retiring age—65 for men and 60 for women. Of course not all those of working age do work and not all those above working age have retired, nevertheless the ratio between population not of working

age and the total is a useful statistic as it does provide a rough guide to the numbers who have to be supported out of the current national income but who do not contribute to it. This ratio is rising and will continue to rise. In 1965 23.3 per cent of the U.K. population was below working age and 15.0 per cent above. By 1980 it is fairly certain that 16 per cent of the population will be above working age and much more speculatively it is guessed that 26 per cent will be below. So the population not of working age will rise from 38.3 to 42 per cent. The expected growth in the proportion of the old explains why the proportion on pensions (see G242) is going to grow steadily. More generally it is clear that some growth in output per worker will be needed to meet the needs of the increasing proportion of dependants

The Working Population

Not all persons of working age actually work, although the vast majority do but only a part are gainfully employed *i.e.* work for wages salaries and profits. And it is only those who are gainfully employed who are counted in the working population. Housewives mothers and those who give their services gratis to good causes are excluded unless they also do some work for cash. In 1965 when the total population of Great Britain was 53 million of whom 32.7 million were of working age the total working population (including the unemployed who are seeking employment) was only 25.5 million. Of the 17.5 million women of working age only 8.8 million were gainfully employed. So for every person gainfully occupied there was just over one other person to be supported out of the goods and services they provided. One feature of the post war years was a steady increase in the proportion of persons going out to work. Whereas in 1965 78 per cent of the working age population was gainfully employed in 1955 the figure was only 66 per cent.

or less inevitable. Some seasonal rise in unemployment in the winter must be expected *et cetera* in seaside towns and for this reason unemployment in January is half a per cent or so higher than in June. Moreover some unemployment is bound to be involved in job changing and as the demands of industries change. Full employment means that there should be about as many jobs vacant as there are workers looking for jobs. A large excess of vacancies is evidence of inflationary pressure in the labour market for it means that the employers needing workers to meet the demands for their products will have to compete with each other by bidding up wages.

To some extent unemployment figures are misleading as not all unemployed workers are eligible for unemployment benefit under the National Insurance Scheme. Most married women who go out to work normally opt not to pay the full National Insurance contributions so that when they become unemployed they just drop out of the working population. Unemployment figures definitely understate the seriousness of recessions as they do not count all the persons who would like to have but cannot find jobs. Of the 517 000 persons unemployed in mid 1964 240 000 were men and 77 000 women. Of the men over half 147 000 had been unemployed for over eight weeks. Thus long term unemployment was nearly 1 per cent of the labour force serious enough for those affected but not the kind of unemployment to be cured easily by inflationary measures.

Regional Unemployment

A peculiarly dreadful feature of the inter war years was the emergence of the depressed areas—the regions of the country where a third of the men had not had a job for a year or more. Such extreme regional unemployment has not recurred since 1945 only in Northern Ireland was unemployment very high. Between 1954 and 1964

DISTRIBUTION OF WORKING POPULATION JUNE 1965
(Thousands)

Basic Industries		Manufacturing Industries		Services	
Agriculture and fishing	486	Food drink and tobacco	810	Distribution trades	2 961
Mining and quarrying	624	Chemicals and allied industries	510	Financial professional and scientific services	3 045
Construction	1 656	Metal manufacture	632	Catering hotels etc	612
Gas electricity and water	411	Vehicles	862	Public administration	
Transport and communication	1 628	Engineering and other metal goods	2 848	National	545
		Textiles	767	Local	758
		Paper printing and publishing	633	Miscellaneous	1 574
		Other manufacturing	1 779		
Total	4 805	Total	8 846	Total	9 490
Percentage of working population	20.3		38.2		41.0

Most of the working population work for wages or salaries as employees. Of the total for Great Britain in June 1965 of 25.5 million 1.7 million were employers or self employed 0.4 million were in the Forces and 23.4 million were either employees or unemployed persons looking for work. The table shows the industries in which people work. Some 38 per cent of the total work in manufacturing industry 2.8 million of these in engineering and allied industries 21 per cent work in the basic industries and the remaining 41 per cent are in the so-called service industries.

Employment and Unemployment

In 1965 an average of 329 000 persons—1.4 per cent of the working population—were unemployed. Even in January 1959 the worst month of the 1950s the rate rose only to 2.8 per cent and in February 1963—an exceptional month—to 3.9 per cent. In most post war years the average was lower than 1.5 per cent. This contrasts with an average figure in 1937 the best year of the 1930s of 11 per cent and with a figure of 22 per cent at the bottom of the slump in 1932. Probably 1-1.5 per cent is somewhere near the practicable minimum for some unemployment is more

unemployment there ranged between 6 and 10 per cent. Nevertheless regional inequalities exist.

UNEMPLOYMENT AND VACANCIES
(Great Britain thousands)

	Unemployment (annual average)	Vacancies (End of period)	Unemployment as percentage of total employees
1932*	2 829	n.a.	22.1

DECREASE IN EMPLOYMENT IN
SELECTED INDUSTRIES 1945-65

	Thousands	Per cent
Textiles	224	23
Mining and quarrying	242	28
Shipbuilding	77	27
Agriculture, forestry and fishing	221	21

In February 1963—during a period of recession and also cold weather—the percentage of all workers unemployed in Great Britain was 3.9. But the table shows a lower proportion of the labour force was unemployed in the Midlands and the South and that there was a much higher percentage of unemployment in the North in Scotland and in Northern Ireland. Moreover the labour shortage of early 1965 was not shared equally: unemployment remained significant in these areas. In this situation checks have to be placed on the economy before full employment is reached because in the booming areas vacancies far exceed unemployment.

One of the main reasons for the regional pattern of unemployment is that certain industries and services in which big changes have been taking place tend to be grouped in specific regions. Most of our early industrial centres had to be established close to coal, iron ore and adequate water supplies. But employment in many long established industries has recently been declining. The scale of this contraction can be seen from the table. On the other hand new and growing industries and their related offices have been concentrated in Greater London, the South East and the Midlands. The growth of services too has centred on the areas where industry is booming and population is increasing. In the absence of Government intervention the process would tend to become cumulative and regional inequalities would grow rather than diminish.

National Income

Gross domestic income (GDI) is the sum total of incomes received for the services of labour, land or capital in a country. Gross domestic product (GDP) is the money value of all the goods and services produced in the country. So as to avoid double counting only the *value added* at each stage of production is included: firms' purchases are excluded. The revenue from selling the GDP is either paid out to the hired factors of production—labour, land, and capital—or retained in the form of profits. Therefore provided it is calculated net of taxes on goods produced, GDP must equal GDI. To estimate gross national income from GDI it is necessary to add the net income—such as profits and interest—received from abroad. If an allowance is made for wear and tear of the nation's capital equipment *i.e.* for *capital consumption* we arrive at net national income, better known as the *national income*.

In 1965 the national income of the United Kingdom

was £28,280 million, implying a national income per head of £513. In 1955 the corresponding figures had been £15,514 million and £308 per head. However, only part of the increase in value was due to an increase in the quantity of goods and services produced; some of the increase simply reflected a rise in prices. It is important to calculate changes in the volume of output—known as *real output*—as well as changes in its value. Real output is calculated by the statistical device of constructing an index number. This is done by calculating the volume of goods and services provided in each year and then valuing these goods and services at the prices found in one particular year. Thus between 1955 and 1965 the money value of national income rose by 82 per cent, whereas real output increased by only 33 per cent and the difference represented a rise in prices.

In real terms national income per head rose by 24 per cent between 1955 and 1965 or by 2.2 per cent per annum. National income per head is the most useful indicator of the standard of living. However, this measure is necessarily a crude one. For instance, it cannot take account of new products *e.g.* television or the plastic bucket, nor of changes in the distribution of income between rich and the poor, nor of the quality of life affected by such things as traffic jams and more less zones, nor of the length of the working week.

Industrial Production

It is fairly easy to measure output in the manufacturing industries and in many of the basic industries. It is much more difficult to do so for the service industries: the output of a doctor or a teacher is not easily measured. So each month the Central Statistical Office calculates the *index of industrial production* covering the main productive industries. However, this tends to give a false impression of the rate of growth of output since the industrial sector is the one best placed to raise its output per head and for which demand expands most rapidly. Roughly a 5 per cent increase in industrial output is likely to be accompanied by a 3 per cent increase in GDP, on which the average standard of living depends.

Manufacturing industry accounts for more than three quarters of industrial production. Within manufacturing industry two industries have expanded most rapidly—chemicals, which includes drugs, plastics, cosmetics, detergents and oil refining, and vehicles, which includes cars, tractors, commercial vehicles and aircraft. The slowest growing manufacturing industries are textiles and shipbuilding, which are losing their markets to cheaper competitors. Those industries in which demand has stagnated are also the industries in which output per employee *i.e.* productivity has stagnated.

International Comparisons

Between 1955 and 1964 Britain's GDP grew less rapidly than that of any other country listed in the table except the U.S.A. The British economy was also characterised by a relatively slow growth of output per head *i.e.* productivity. Many explanations of Britain's poor performance have been suggested and there is by no means agreement on this matter among economists. It has been argued that the U.K.—like the U.S.A.—has a highly advanced economy in which there is a relatively high demand for services and that it is difficult to raise productivity in the large services sector. Another argument is that Britain has been hampered by its slowly growing labour force, which has restricted growth not only in output but also in output per man. The reason given is that an expanding labour force needs to be equipped with additional plant and machinery so that its capital equipment tends to be newer on average than that used by a static labour force and thus more up-to-date and efficient.

Some commentators have put the blame on the inefficiency of our business management, some on our educational system, biased towards the humanities, some on the social milieu which looks down on money making as a career, some on over-manning and other restrictive practices of trade unions. A good deal of attention has

AN INTERNATIONAL GROWTH LEAGUE TABLE

	Percentage change per annum 1955-64			Investment as percentage of G N P	
	Output	Employment	Output per head	Including dwellings	Excluding dwellings
Japan	10.4	1.4	8.8	28.8	21.5
W. Germany	6.3	1.3	5.0	23.7	18.4
Italy	5.7	0.1	5.6	21.6	15.6
Sweden	5.4	1.5	3.9	22.8	17.4
France	5.2	0.8	4.9	19.2	14.3
Denmark	5.0	1.2	3.8	18.7	15.4
Belgium	3.6	0.6	3.0	18.4	13.7
U S A	3.1	1.1	2.0	17.1	12.2
U K	3.1	0.5	2.6	15.8	12.7

also been paid to the proportion of output which different countries devote to investment i.e. expenditure on commodities—such as plant and machinery—for use in future production. These investment ratios are shown in the table. With the exception of the U S A, all countries have investment ratios considerably higher than in the U K, with correspondingly higher growth rates of output and productivity. Since investment in dwellings contributes very little to growth it is appropriate to exclude this investment, however the same results are obtained. This leads to the hypothesis that Britain's growth rate could be raised if a higher proportion of output were devoted to investment particularly in plant and machinery. There is probably some truth in many of these explanations and it is unlikely that any one remedy will be sufficient to raise the British growth rate.

Capital and Automation

Many of the growing industries are capital intensive: they use much machinery and equipment per unit of output produced. In chemicals steel and above all electricity the plant is extremely expensive. Most of the innovations since the war—nylon, atomic power, electronics, polythene etc.—require a high capital investment and cannot pay unless they are worked nearly full out. One way to achieve this is by shift work, and it may be that a full exploitation of the potentialities of these new industries will require a greater extension of this system of work. And the future holds out prospects of still more intensive requirements for capital as automation spreads. With automation much of the manual semi-skilled work should come to an end. The new electronic computers will be able to control the machines that actually do the manufacturing operations. Transfer machines can read details of the work to be done off a piece of tape; they can adjust themselves to correct mistakes or to adjust for faulty materials.

So far the impact of automation has been small. The main use has been in the office where electronic computers can carry out far more efficiently much of the routine calculating, recording and checking operations previously done by clerks. But it will continue to spread and must do so if the growth in wealth is to continue. The change will come only gradually. But ultimately one can envisage that both in manufacturing industry and in office work the machine will have replaced much of the human effort in work and even more of its drudgery. The typical manual job will become that of the skilled maintenance man.

This revolution will take many decades to effect. It raises no spectre of widespread redundancy but it does mean that over the years more and more emphasis will need to be laid on the training of workers for skilled work and indeed on raising the general level of education. Also over the years the average size of factory is likely to grow as these new methods if they are to be profitable have to be used on a large scale. Finally the prospect is for ever increasing requirements of capital—and of course for the savings to finance it.

Investment

In 1965 gross investment in capital assets amounted to £6,252 million. This is about 20 per

cent of the gross national product (GNP). In other words about one part in five of total production was used to replace old assets or to add to the nation's stock of capital equipment. The addition to the stock of capital assets (net investment) accounts for 60 per cent of gross investment; the remainder is needed to offset the wastage of assets already in use. We have seen (above) that the proportion of total output invested in Britain is lower than in countries with faster growth rates of output and productivity, and there is reason to believe that a higher proportion would improve the growth rate. But a rise in the investment ratio would involve a fall in other forms of expenditure, notably private and public consumption, and this would have to be brought about by increasing taxation or encouraging people to save. In other words a faster rate of growth—and therefore higher consumption in the future—which was achieved by this method would involve a sacrifice in current consumption. A choice must be made between the loss in current consumption and the ensuing gain in future consumption. Of course not all consumption expenditure is equally important to the standard of living: some would argue that if defence expenditure was pruned to permit more investment there would be no loss to set against the future gain.

Types of Investment

There are four main kinds of investment: plant and machinery, vehicles, dwellings and other construction. In 1965 the four categories accounted for 37, 10, 21 and 32 per cent respectively of total gross investment. Investment may also be analysed by the purpose for which it is used. It is clear from the table that some sectors are more capital intensive than others. Manufacturing and social services (such as education and health) take a surprisingly small proportion of total investment; distribution (retail, wholesale, banking and finance) and public utilities and services take a large proportion. Investment in electricity alone accounts for 10 per cent of the total. Investment in real terms rose most rapidly for social services and for distribution over the decade; manufacturing, other production industries and transport fared badly.

GROSS INVESTMENT BY PURPOSE
1965

	Percentage of total 1965	Percentage increase 1955-65
Manufacturing	21	48
Other production in dustries	7	36
Transport	9	46
Distribution	17	127
Public utilities and services	20	121
Housing	20	62
Other social services	6	155
Total	100	76

The Finance of Investment

Any business is allowed to charge as a cost the depreciation of its assets. Normal depreciation allowances are based on the original cost of the asset and on its expected useful life. In a time of price inflation depreciation allowances will not provide sufficient finance to permit the replacement of assets at higher prices and there are many supporters of depreciation allowances being based on replacement costs. Many firms do set aside extra funds specifically to cover these extra replacement costs.

Governments have however adopted certain fiscal devices to encourage replacement and investment. Soon after the war initial allowances were introduced. Under this system firms were permitted to charge against profits in the first year of its life 20 per cent at times 40 per cent of the cost of any new equipment and the system amounted to a loan of the tax saved in the first year repaid over the life of the asset. In 1954 initial allowances for machinery were replaced by a system of investment allowances under which a firm could charge against profits 20 per cent of the cost of any new machine with the difference that all ordinary depreciation allowances were still chargeable. So the investment allowance was a grant not a loan of the saved tax. In 1966 it was announced that initial and investment allowances on new plant and machinery in the key sectors—manufacturing mining and shipbuilding—would be replaced by cash grants. Other plant and machinery and industrial buildings would receive higher initial allowances. In 1970 the new Conservative Government announced that investment grants would be replaced by a system of 60 per cent initial allowances.

Depreciation allowances and government allowances and grants for investment are sufficient to cover the majority of investment (excluding dwellings) by the private sector and to cover a minor part of public (non housing) investment. The residue of investment and housebuilding has to be provided from savings. Companies rely mainly on retained profits which are often larger than companies as a whole than their net investment and so too do the profit making nationalised industries. Much public investment must be financed by the Treasury.

Monopoly and Competition.

This trend to increasing size and increasing capitalisation has been going on now for many decades and in the process it has changed the face of British industry. In the early 19th cent the typical firm was the owner managed textile mill. Then in the 1860s and 1870s came the discovery of cheap methods of making steel with the consequential immense growth in the engineering industries. Most of the chemical industry is still newer—some very new—and in these capital intensive industries the big firm predominates. In some it has become almost a monopoly: no small firm can easily challenge industrial giants like Imperial Chemical Industries the Dunlop Rubber Company or Unilever. In others the pattern is of a few firms all large as in motor cars, detergents and steel. Competition goes on but it has changed its form. In the old days competition was largely by price. Now it is largely by advertising and by variations in the quality and other features of the product—detergents and motor cars being good examples. And in many industries groups of firms producing similar products entered into agreements which had the effect of restricting competition for example through schemes for price fixing.

Legislation against Restrictive Practices

The Restrictive Practices Act of 1956 outlawed many of the main forms of restrictive agreements to prevent competition. Collective price fixing was declared to be illegal unless the industry could show that the practice brought substantial benefit to the public. Collective price-fixing was the system under which a central association for the industry lays down minimum prices at which members may sell. Usually such a system was backed by arrangements for collective boycotts under which members of the association would

refuse to sell goods to wholesalers or retailers who broke the rules. Often the wholesalers too were in the scheme and they would collectively refuse to buy from manufacturers who broke the rules. Collective boycotts were also found in industries without collective price fixing: one common purpose being to make sure that retailers did not sell a manufacturer's products below his recommended price. This form of collective resale price maintenance was also outlawed by the Act. Under the Act any restrictive agreements of several specified kinds had to be registered with the Registrar of Restrictive Practices. He then had to decide whether there was a *prima facie* case for the discontinuation of the agreement and if he thought there was the case was referred to a new Restrictive Practices Court containing both judicial and lay members.

The Act of 1956 permitted individual manufacturers to enforce resale price maintenance (r.p.m.) for their own products. Few suppliers would want the publicity of enforcing r.p.m. through the courts but individual suppliers could still put some commercial pressure on price cutters e.g. by offering less favourable terms or by refusing them supplies. The Resale Prices Act of 1964 prohibited all methods of enforcing minimum resale prices. However goods which had been registered in due time with the Registrar of restrictive trading agreements or have been approved by the Restrictive Practices Court were exempted temporarily in the former case and permanently in the latter. For r.p.m. to be approved by the Court it must be shown that some ensuing benefit to consumers (e.g. of increased quality or more retail outlets) outweighed any detriment. It is also lawful to withhold supplies to retailers selling goods at a loss to attract customers. The list of applications for exemption is a long one but the effect of the Act should be lower prices in the shops. It will also mean a more rapid decline of small retailers.

The Restrictive Practices Acts leave untouched the industries where one firm is dominant: these remain the responsibility of the Monopolies Commission who report on industries referred to them by the Board of Trade and make recommendations after investigation. The Monopolies and Mergers Act of 1965 strengthened control over monopolies and mergers. With regard to monopolies the Government wished to provide itself with legal powers of enforcement: previously monopolies had been expected to comply voluntarily with the findings of the Monopolies Commission. The Act also permits the Government to refer a merger or a proposed merger to the Monopolies Commission in cases where the merger would lead to monopoly (defined as control of at least one third of the market) or would increase the power of an existing monopoly or where the value of the assets taken over exceeds £5 million. But it would be wrong to presume that mergers are always bad mergers—by facilitating research and other economies of large scale operation—may increase industrial efficiency. For this reason the Labour Government established an Industrial Reorganisation Corporation to promote the grouping of firms in cases where such grouping would be beneficial to their industry, but in 1970 the Conservative Government decided to wind it up.

Restrictive labour practices—which result in the over-manning of plant or the under-employment of men—are common in British industry. These stem from such causes as the fear of redundancy and unemployment anxiety to preserve a craft skill threatened by technical progress, the desire to work at overtime rates and sometimes just inertia. In the fully employed economy of the 1960s redundancy should not be a problem and under employed labour is urgently needed elsewhere. The elimination of these restrictive practices requires more enlightened management, more union co-operation, and more Government measures to promote the mobility of labour between occupations.

Nationalised Industries

Nationalised industry accounts for about 20 per cent of British industry. Local authorities also run some services—largely in bus transport and water provision. With the exception of coal

mining all these industries are natural monopolies in which the provision of competing services would be obviously wasteful. They are thus obvious candidates for nationalisation. With the exception of steel—nationalised 1951-53 and re-nationalised in 1967—nationalisation has not been extended into manufacturing industry not even where the existence of a private monopoly might suggest that there was a strong case. But nationalised industries are not free from competition. The railways face competition from road transport, some publicly and some privately owned. The fuel industries compete with each other and with the privately owned oil industry.

Nationalised industries are supposed to earn enough to cover their costs. In the first ten years the two airways corporations were granted subsidies but these have now ceased. Costs for a nationalised industry include interest payments on capital—both on the compensation paid to the previous owners and on the rather larger amounts of capital raised since nationalisation. The electricity boards and to a lesser extent the gas boards earn something above their costs to finance expansion but not even then on the scale which is normal practice in private industries. The National Coal Board has accumulated a deficit by not increasing coal prices sufficiently to meet the increasing costs of production. British Rail has been in chronic deficit which it was the object of the Beeching Report to reduce.

The nationalised industries are voracious users of capital as they are nearly all highly capitalised industries. Until 1956 they raised new capital when they wanted it by floating an issue on the Stock Exchange the issue being guaranteed by the Government. Since then the nationalised industries have drawn directly on the Exchequer for their capital. This system has been attacked on both sides. The advocates of private enterprise have pointed to the strain this puts on the Exchequer and to the unfairness whereby the nationalised industries get their capital cheaper or more easily than private industry. From the other side it has been pointed out that the nationalised industries have suffered from their dependence on the Exchequer. In times of balance of payments crises the nationalised industries have been forced by the Government to cut back their planned programmes sometimes at serious cost in disorganisation.

3 INCOMES, WAGES AND PRICES

Personal Income Spending and Saving

National income is a measure of the total income accruing to residents in return for services rendered. It therefore consists of the sum of wages, salaries, profits and rents. Not all this income accrues to persons. Thus companies do not distribute all their profits to shareholders. In 1965 undistributed profits amounted to £4 040 million. This is part of national income but not of personal income. On the other hand some personal incomes are not payments for services rendered. Such incomes are called transfer incomes to emphasise that their payment does not add to the national income but only transfers income from one recipient to another. Included in this category are retirement pensions, children's allowances, National Assistance payments, etc. amounting in 1965 to £2 724 million and the interest on the National Debt paid out to persons. Total personal income in 1965 was £29 786 million.

The table shows what happened to this income. Direct taxation—income tax and surtax—took about 11 per cent of total personal income and National Insurance contributions, which being compulsory are in effect a form of tax, took a further 6 per cent. The remainder of personal income—called disposable income—was available for spending or saving. In 1965 total personal savings amounted to 6 per cent of personal income and 8 per cent of personal disposable income.

The other 92 per cent of disposable income was spent on consumption goods and services. Consumption expenditure in turn was broken down in the following way: a quarter on food, an eighth on drink and tobacco, 16 per cent on housing, fuel, and light, 9 per cent on clothing, 8 per cent on durable goods (motor cars, television

sets, refrigerators, etc.) 7 per cent on travel leaving just over a fifth for other goods and services. Almost as much was spent on drink and tobacco as on housing, fuel and light. This is partly because drink and tobacco is subject to heavy indirect taxation which is the same even to taxes which are levied on particular goods and services. Thus nearly three quarters of expenditure on tobacco goes to the Government. Total indirect taxation on consumers expenditure amounted to £4 196 million in 1965, though this was offset by subsidies—payments by the Government towards the cost of particular goods and services, mainly some foods and housing—amounting to £508 million.

DISPOSAL OF PERSONAL INCOME 1965

	£ million	Per centage
Total Personal Income	29 700	100
less		
Direct Taxes	3 890	11
National Insurance contributions	1 690	6
Disposable Income	24 620	83
Available for		
Consumption	22 710	77
Saving	1 910	6

Types of Personal Income

Compare the sources of personal income in 1933 and in 1963. We see in the table that income from employment increased considerably largely owing to a rise in the salary bill. The reason is not that salaries have increased faster than wages but rather that the number of salaried workers has increased much faster than the number of wage earners. There has also been an increase in the proportion of incomes derived from public grants—old age pensions, war pensions, sickness benefits, student grants, etc.

SOURCES OF PERSONAL INCOME 1933 AND 1963 (As percentage of total)

	1933	1963
Income from employment	59.5	71
of which		
wages	38	39
salaries	18	26
Forces pay	1.5	1.5
employers contributions*	2.5	5.5
Income from self employment	12.5	9
of which		
professional persons	2	1.5
farmers	1.5	2
others	9	5
Income from property	22.5	11.5
Grants from public authorities	5.5	8.5
Total	100	100

* To National Insurance and other superannuation schemes

The types of income which have fallen as a proportion of the total are incomes of self-employed persons and incomes from property. During the war and for several years afterwards property incomes changed little—the effects of rent control, excess profits tax and low interest rates were such that these incomes did not rise while other incomes increased sharply. In more recent years there was a rise as rent control on some property was lifted and as interest rates increased, but nevertheless the share of property incomes in 1963 was only about half of what it had been in 1933. Over this quarter of a century

there was a fundamental redistribution of income away from property owners towards employees

Incomes by Size

In 1964 over 70 per cent of income receivers had incomes under £1 000 and over 90 per cent under £1 500. The remaining 9 per cent with incomes over £1 500 received 27 per cent of the total income and the top 1 per cent received 8 per cent of the total. Thus Britain is far from being an egalitarian society: income is still very unevenly distributed but not so unevenly as before the war.

allowance now adds substantially to spending power. As tax rates have risen it has become increasingly profitable for such classes to claim every expense to which they are conceivably entitled. Particularly important are cars required for business and also used for pleasure.

Second only in 1965 did capital gains become taxable. If one buys an asset which then rises in value one has clearly gained extra spending power. Not only have people in Britain been exempt from tax on capital gains a considerable advantage in periods of boom in ordinary share prices but also they have been able by a number

BRITISH INCOMES BY SIZE 1964

Range of incomes before tax	As percentage of total			
	Number of incomes	Incomes before tax	Incomes after tax	Rates of tax as percentage
£50-£250	14	3	4	0
£250-£500	22	10	11	2
£500-£1 000	25	31	33	6
£1 000-£1 500	20	29	30	9
£1 500-£2 000	5	11	10	14
£2 000-£3 000	2	6	5	20
£3 000-£5 000	1	4	3	27
£5 000-	0.5	6	4	46
Total	27.5m	£22 885 m	£20 268 m	11

when the top 1 per cent received 16 per cent of total income.

Taxes on income are of course highly progressive rising sharply as income increases. Those with low incomes pay no income tax and in so far as they are pensioners no compulsory contributions either. We see from the table that the proportion of income paid in direct taxes rises from 2 per cent in the income bracket £250-£500 to 9 per cent in the bracket £1 000-£1 500 to 46 per cent for incomes exceeding £5 000 per annum.

This tax burden somewhat changes the distribution of incomes. After tax the top 9 per cent received only 23 per cent and the top 1 per cent only 5.5 per cent of total incomes. But the redistributive effect of taxation must not be overstressed: the levelling up of incomes before tax has been very much more important in making Britain rather more egalitarian than has been any taxation policy.

Income and Spending Power

In many ways figures for incomes alone substantially overestimate the degree of equality found in Britain. First incomes are incomes as defined for income tax purposes. Any allowed

of devices to convert income into capital gains and thus avoid paying income tax. Before 1965 various Chancellors of the Exchequer merely tried to close loopholes by making illegal various transactions aimed at tax avoidance.

Distribution of Capital.

Spending power depends not only on income and capital gains but also on the sheer amount of capital owned and in respect of capital Britain is still far from egalitarian. The only figures are those that arise in connection with the payment of death duties. In 1984/5 those who at death left estates of more than £5 000—just over a fifth of the total numbers dying—owned 77 per cent of the total and the richest 1 per cent owned 24 per cent of the total. And this in spite of a growing tendency for the rich to pass on their money before death to avoid death duties. Compared with 1938 the main change appears to be that the fairly rich are more numerous and the extremely rich are somewhat less numerous. The vast majority still own very little and Britain is far from being a property owning democracy.

Wages and Salaries

In 1965 two thirds of personal income was paid in the form either of wages salaries or Forces pay. The distinction between the first two is

DISTRIBUTION OF WEALTH VALUE
OF ESTATES FOR DEATH DUTIES
1964/5

Size of estate £ 000	As percentage of total	
	Number of estates	Value of estates
1-1	38	3
1-2	17	5
2-3	11	5
3-5	18	10
5-10	11	14
10-25	6	19
25-50	2	15
50-100	1	13
100-	0.4	16
Total	295 798	£1 531 m

expenses are excluded and for the self employed and the higher ranks of management the expense

WAGE AND SALARY LEVELS IN
MANUFACTURING INDUSTRY
(Earnings per week October 1960)

	Administrative Clerical and Technical Staff		Wage earners (Adults only)
	Monthly paid	Weekly paid	
Men	£35 19s	£24 9s	£25 10s
Women	£15 14s	£12 0s	£12 2s

very much a matter of convention: many salary earners now earn less than wage earners and the main division is between those salary-earners who are paid monthly and the rest. This we see in the table. Even though weekly paid staff do not now earn more than wage-earners they may

still in effect be better off for they generally work shorter hours are more likely to be covered by private superannuation schemes and usually work in better conditions.

No regular statistics are collected about salary levels but every half year the Department of Employment publishes detailed figures of the actual earnings in one week of wage earners in a wide range of industries. There is a considerable variation in earnings between industries. Manufacturing industries pay well and within manufacturing industries vehicles and paper printing and publishing pay the highest weekly wages. Public administration (including local government road men and the like) is a low wage sector particularly for men. For women the best paying industry is the buses where there is equal pay for male and female conductors. It should be borne in mind however that the average earnings for an industry may disguise a wide dispersion of earnings among firms of the industry and also within firms.

AVERAGE WEEKLY EARNINGS OF
MANUAL WORKERS IN CERTAIN
INDUSTRIES
(October 1969)

	Men	Women
Vehicles	£28 13s	£14 13s

Differentials

Women earn on average much less than men and juveniles usually much less than adults. Before the war the gap was relatively greater. Men for instance earned 5.6 times as much in October 1965 as they did in October 1953 but for women the ratio was 6.2 times. Nearly all this narrowing occurred during the war when it was the common practice for wage advances to take the form of a flat rate increase to all employees regardless of sex. Since 1950 the practice has altered. The usual thing has been to grant roughly similar percentage increases to all grades and there has in fact been a slight widening of the gap.

The same narrowing occurred in other differentials. Skilled workers for instance were during the war granted the same flat rate advances as unskilled and there was then and to some extent also in the years immediately after the war a sharp narrowing of the reward for skill in many industries. As for the sex differential the narrowing has now come to a halt but it has not been reversed and wages within the working class are much less widely spread than they used to be. Some would say the rewards for skill were in sufficient but on the other hand the upgrading of the lowest paid has together with the reduction in long term unemployment been the main means by which the grinding poverty of the worst off members of society—with all its undesirable consequences such as malnutrition of children—has been eliminated. Today the really numerous poor are the old and the handicapped—and not as before the war families with a working head who was earning too little to make ends meet.

Differentials have been a major source of industrial strife in some industries. In engineering there has been continued conflict between unions and with membership largely among the skilled and those with membership largely among the semi-skilled over what form demands for wage increases should take. On the railways the strife has been even more open.

Overtime and Short time

The earnings of any individual worker depend on many factors and are usually far above the minimum wage rates payable for a week. They include overtime earnings and overtime working is common for men. In most weeks about 2 million workers in manufacturing will be working overtime to the extent of 8 to 9 hours. So the average week in 1969 was 46 hours which is about 6 hours above the average standard working week without overtime. In the transport industry the average working week for men was as much as 51 hours. Indeed the average working week in 1960 was higher than before the war even though the standard working week had been reduced. In most industries it was cut by 4 hours soon after the war from 48 to 44 hours. A 42 hour week was introduced between 1960 and 1962 and there was a movement towards a 40 hour standard working week between 1964 and 1966.

Short time the working of less than the standard week has not been common since the war. It has been important in particular industries at particular times but even in February 1963 at the bottom of the recession it was far smaller than overtime. Then 160,000 workers were on an average short time of 12.5 hours—a total of 2.0 million hours lost as against 12.7 million hours of overtime in the same week.

Earnings and Rates

Overtime is not however the main reason why earnings exceed minimum wage rates for most workers earn very much more than the minimum in the standard working week. One reason is payment by results the system of payment under which the worker's wage depends partly on output. The commonest form is still the piecework system under which pieceworkers are paid a fixed low rate per hour for each hour worked plus a fixed piecework price for each operation performed. But increasingly employers tend to prefer as a more effective incentive some scheme under which the bonus payment is related to the output of a larger group or to that of a whole factory. With payment by results systems—these cover about 40 per cent of the workers in manufacturing industry—earnings rise as productivity rises and as usually such workers also participate in advances in wage rates negotiated between employers and unions the gap between earnings and wage rates tends to widen for them. So workers not paid by results press for similar advances for themselves and in times of booming trade get them under a wide variety of names and forms—merit payments, lien rates, commission bonuses etc.

Between 1959 and 1969 wage rates rose by 52 per cent and earnings by 80 per cent. The advance in rates was little more than the rise in retail prices—only 11 per cent—so that anyone who actually earned the minimum rate throughout was not much better off. But earnings rose by 39 per cent more than prices so that the main source of the extra real income of the working class is to be found in the widening gap between earnings and rates.

Wage Negotiation

In Britain there were 10.0 million trade union members in 530 unions in 1968. Most of these unions are very small over 350 having less than 2,500 members but 19 have a membership of over 100,000. The main job of unions is collective bargaining with employers and in most industries most employers also belong to associations which bargain collectively on their behalf. Some big firms however prefer to remain outside the associations and strike their own bargain with the unions. Before the war many firms tried to encourage the formation of Company Unions i.e. of unions confined to employees of a single firm but this is now uncommon. In some lowly paid trades—catering, baking, dressmaking and others—minimum wages are fixed by Wages Board or Councils set up by the Department of Employment and representatives of the workers and employers and independent members meet together to reach agreement on the settlement to be recommended to the Minister. But over most of industry the aim of collective bargaining is to reach voluntary agreement and the Department of Employment intervenes only when no agree-

ment is reached. Even in the nationalised industries the Government does not usually intervene unless negotiations between the Boards and the unions break down.

The usual pattern of negotiation is like this: first the union puts in a claim for an all round increase usually much larger than it expects to get. Then after a time the employers reply often offering a much smaller increase and sometimes none at all. They then argue round a table until either they reach agreement or they definitely fail to reach agreement. If the latter happens the next step varies considerably from industry to industry. Many industries have their own conciliation machinery in which outsiders try to help the two sides to reach agreement. Some though not many also have their own arbitration machinery in which outsiders can recommend a solution of the dispute which is sometimes binding and sometimes not. It depends on what the two sides have agreed on in advance. Many industries have no machinery of their own and depend on the general facilities the Minister responsible can offer. He may appoint an impartial conciliator or he may with the agreement of both parties refer the matter to the Industrial Court which arbitrates between the parties or he may set up a Court of Enquiry which enquires into the dispute and makes recommendations which are not binding on the parties or he may decide to do nothing at all if he judges intervention to be useless. Nor need either unions or employers call him in: the former may opt to put pressure on the employers immediately either by strike action or by banning overtime or piece work, or by other action.

Thus the British Government traditionally has little power to control wages directly or to impose agreements. The recent attempts to introduce compulsion in wage determination are described in Part IV.

Important Negotiations

A few negotiations are particularly important in determining how wages rise in a year for the pattern of later settlements tends roughly to follow those of earlier settlements. Probably the most important of all are those between the Confederation of Engineering and Shipbuilding Unions—an organisation representing 3 million workers—and the Engineering Employers' Federation as this single negotiation directly affects the wages of 3½ million workers and indirectly many more. On several occasions since the war negotiations between these two have broken down and only finally been settled after a Court of Enquiry had recommended a compromise wage advance. The Confederation is a special negotiating body comprising all the unions who have members working in the engineering and shipbuilding industries. These include many small skilled workers' unions such as the Patternmakers' Union but they also include besides the 1 million strong Amalgamated Engineering Union the two large general unions the Transport and General Workers' Union, with about 1½ million members and the General and Municipal Workers' Union, with not far short of a million. These last two represent the semi skilled and unskilled workers and conflict between them and the skilled unions concerning differentials is common.

Another often important negotiation is that between the British Transport Commission and the three railway unions—the large National Union of Railwaymen representing most grades the Amalgamated Society of Locomotive Engineers and Firemen representing the drivers and the firemen and the Transport Salaried Staffs Association, representing the ticket collectors railway clerks etc. The importance of this negotiation lies in the fact that railwaymen are comparatively badly paid but as the Transport Commission runs a deficit, any wage advance has effectively to be paid for by the Government. Time and time again—for example the rise in early 1960 arising out of the Gulleband Report on railway pay—wage advances have been given to railway men with the purpose of trying to narrow the gap between them and other workers but the advance given to railwaymen then acts as a guide to other settlements so that the railwaymen remain relatively as badly paid as before.

Strikes

The strike is the unions' weapon of last resort. Most unions maintain strike funds in order to support their members when they call them out on strike but these funds are small and strike pay is usually very much below normal wages. So unions cannot afford to call strikes irresponsibly and major official strikes are uncommon. In most years there will be one or two but not more and the total number of working days lost is usually negligible—less than one day per head. Even in the industry affected the lost working days are usually made up in the following weeks by overtime.

Nevertheless the big strikes are important for the success or failure of one big strike can affect the results of all the other collective bargaining under way at the time. They can also affect the awards of arbitration tribunals since in the main arbitration awards tend to follow the pattern of settlements already made in other industries. There is no purpose in a tribunal trying to be fair if it cannot get its awards accepted. So the settlement reached as a result of a strike often determines the amount by which wage rates will rise on average over all industries.

Most strikes are neither large nor official nor about wages. An official strike is one called by a union usually by decision of the national executive and is usually the result of a breakdown in collective bargaining about wages. But unofficial strikes called by local leaders with the authorisation of unions are usually about other matters. Few of the big unofficial strikes which have plagued the London Docks since the war were about wages but usually about some relative triviality that only bore witness to the thoroughly poor state of labour relations in that industry. Much the same may be said about the continual strikes in shipbuilding many of them caused by demarcation disputes concerning which jobs should be done by which type of skilled worker. These sort of strikes are really a form of industrial protest and the employers have to bear their share of the blame.

In 1965 there were in all 2 350 strikes in the United Kingdom 869 000 workers were directly or indirectly involved and 2 032 000 working days were lost. This means that the average strike involved 370 workers and lasted over 3 days.

In most industries there are very few strikes. The main strike prone industries apart from the mines are vehicles, shipbuilding and docks but even in these the extent of strikes must not be exaggerated. In shipbuilding with the worst record of disputes losses are only just over one day a year and if that were all could safely be ignored. But of course strikes are also a symptom of industrial trouble and it is no accident that in shipbuilding productivity has scarcely improved at all since the war.

Prices and Real Incomes

The aim of a trade union is to get for its members a higher standard of living and its success depends on the extent to which wage advances exceed the rise in the cost-of-living. Prices rose very rapidly

WAGES AND PRICES

(1955 = 100)

	Weekly wage-rates	Weekly earnings	Index of retail prices	Real wage rates	Real earnings
1950	78	68	77	96	91
1955	100	100	100	100	100
1960	124	130	114	109	114
1965	101	175	136	112	129
1969	184	224	159	116	141

(by over 30 per cent) between 1949 and 1953 and earnings only just kept ahead in this period. But since then *real earnings* (i.e. command over goods and services of money earnings) have risen steadily. Thus between 1955 and 1969 the real earnings of a wage-earner rose by 41 per cent.

Real incomes of pensioners and those on National Assistance have gone up too after the serious erosion of their value in the late 1940s. The retirement pension is still inadequate for a decent life but that is because when the National Insurance scheme was set up in 1948 it was believed that the nation could not afford anything better and not because inflation has eroded the value of the pension (see G 24). Inflation can no longer be deplored on the main ground that it leads to much hardship. The main danger is that British exports become uncompetitive and that the balance of payments position deteriorates and puts a brake on the growth of the economy.

Price Changes

In the calculation of real wages it is usual to make use of the *index of retail prices* commonly called the cost of living index. This index is calculated monthly by the Ministry of Labour and in a few industries with sliding scale agreements wages are adjusted to take account of the index. In other industries the index has naturally had an influence on the course of negotiations. Indeed up to 1958 it was probably the dominant influence. In no year before then had the annual rise in prices been less than 2 per cent.

in 1951. Since then however the dominant trend of import prices has been downwards and changes in prices of imports cannot be directly blamed for the continuing rise in prices since 1951. The source has to be looked for in the tenacity of wages salaries profits and other incomes to rise faster than real output and thus they have done in almost every year since the war.

Wages and Prices

Wage increases are probably the most important. When a trade union negotiates a wage advance for all or most of the employees in an industry firms will immediately consider whether they should increase their prices to cover their increased wage costs. As it is common practice for firms to fix the selling prices of their products by first calculating the direct cost of labour and of materials and then adding on a percentage to cover overhead costs and profits they will tend to want to raise their prices not only to cover the cost of the wage advance but also to cover their percentage addition. Moreover in deciding whether or not their customers will stand for such increases firms will be influenced by the knowledge that their competitors have to pay the

INDEX OF RETAIL PRICES
(January 1956 = 100)

	1965 Weight *	Monthly average index				
		1950	1955	1960	1965	1969
Food	311	65	98	107	124	146
Drink	65	94	100	98	127	148
Tobacco	76		98	112	146	168
Housing	109	83	92	132	169	206
Fuel and light	65	65	92	117	150	181
Durable household goods	59	80	94	98	107	151
Clothing and footwear	92	83	98	104	114	125
Transport and vehicles	105	—	—	118	135	157
Services	63	78	97	115	147	186
Other goods	52	77	96	120	140	170
All items	1000	74	97	111	132	155

* *I.e.* proportionate importance of item in total expenditure in 1965

Price changes have not been the same for all types of goods. For instance between 1956 and 1965 when the total index rose by 32 per cent housing went up by 69 per cent and fuel and light by 50 per cent but the prices of food clothing drink and especially durable household goods rose less than the average. Since rent fuel and food form a much higher proportion of total expenditure for the poor and particularly for pensioners than for most households it is possible that prices rose more for the poor than for the rich over these years.

The Causes of Price Inflation

Prices charged in the shops are determined by a great many factors over many of which the Government has little or no control. First among these is the price of imports. Prices of imported food and raw materials are determined in the world markets in which Britain is only one of many purchasers. In the raw material markets the U.S.A. is usually the dominant purchaser and prices depend greatly on the level of economic activity there. In the food markets British purchases are much more important since the U.S.A. grows most of its own food and is a large exporter of some foods. Prices in raw material markets are continually changing and can fluctuate wildly. For instance the average price of copper rose 40 per cent between 1954 and 1955 and then fell back in 1957 to 10 per cent below its 1954 level. Fluctuations at the time of the Korean War were even more fantastic. The price of wool rose over four times and then came down just as abruptly to only a quarter above its earlier level. The price of rubber behaved similarly. The large rise in import prices coming on top of the rise that had been brought about by devaluation, caused the cost of living index to shoot up sharply

increased wages too and will probably therefore be raising their prices. So industry wide wage advances—and changes in costs of materials—are particularly likely to be passed on to the consumer and as wage earners are also consumers to generate further demands for wage advances to cover the increased prices. Profits per unit also go up under this tendency to set prices on a *cost plus* basis but it is the wage advance which tends to set the spiral off by providing the opportunity for price increases.

Once this spiral gets going it is very hard to stop it. In general the requirement is that wage earnings should not rise faster than productivity (output per man). But as in some industries productivity is very slow to rise and as it would be unfair and impracticable to exclude their workers from participating in any general rise in the standard of living this requirement means that in industries with a rapid growth of productivity wage advances should be kept well below the rate of rise of productivity. For two reasons this is rather difficult. First rising productivity often raises the wages of some workers in these industries automatically because they are paid by results or through some incentive scheme. The rise of wages from this source takes the form of a tendency on the part of earnings in these industries to rise faster than wage rates but that does not mean that all employees benefit or that there is any likelihood that the unions in these industries will not press for the same rate of increase in wage rates as is achieved in the slowly growing industries. Second employers in the rapidly growing industries have far less reason to resist demands for wage increases than those in slowly growing industries. Indeed they are quite likely to bid up wages in order to get the labour they need rather than to try to hold down wages.

There are therefore major problems in preventing

ing a faster rise in wages than in productivity with its consequence of rising prices. And once a wage price spiral has started the problems become more acute because unions and employers become accustomed to substantial annual advances in money wages. A main source of continuing price inflation has been the tendency of money wages to continue to advance at a rate that was appropriate when the cost of living was going up sharply but ceased to be appropriate in later years.

The Stopping of Price Inflation

There are several possible methods of attack on the inflationary spiral of wages and prices. Perhaps the most fundamental and certainly the most helpful to other objectives of economic policy is to achieve a faster rate of productivity growth. The faster the growth of average productivity the faster can average incomes rise without an increase in average prices. But if wages and other incomes rise more rapidly than productivity it will be difficult to maintain price stability.

Comprehensive and detailed Government control of wages must probably be ruled out for political and institutional reasons and so must comprehensive and detailed control of prices. Either would involve a much more controlled economy than we have at present and experience suggests that such detailed control would involve a major loss of flexibility in the economy. At the other extreme general exhortations to unions to exercise restraint on wages and to manufacturers to exercise restraint on prices have probably had little effect.

Various intermediate lines of approach have been or could be tried. In 1948-50 the Government secured the co-operation of the T U C in the wages freeze. For a time this was successful but the increases in prices which followed the devaluation in 1949 made substantial increases in wages unavoidable and the freeze was abandoned. By setting an example in the nationalised industries over which it has a more direct influence the Government can encourage employers to take a tougher attitude towards wage claims. This was one strand of policy in the later 1950s. Its disadvantage is the obvious unfairness of a policy which is most likely to be effective in nationalised industries many of whose workers are relatively badly paid. Another approach is to lower tariffs or remove quotas on imports thus exposing some manufacturers at home to tougher competition from abroad. Manufacturers would be less able to raise prices without losing markets and unions would be less willing to press wage claims if there was a real danger that some of their members would lose their jobs as a consequence. But the gains from a policy which depends for its success on higher imports have to be weighed against its effects on the balance of payments. Or again many prices in the economy are directly influenced by Government indirect taxation which raises the price of some goods and Government subsidies which lower the prices of other goods. By manipulating its tax and subsidy policies the Government can exercise a powerful influence on the price level though of course any reduction in indirect taxation or increase in subsidies would probably have to be financed by increases in direct taxation which may in turn have undesirable effects on incentives to harder work and greater effort.

More indirectly the Government can attempt to control the wage price spiral by controlling purchasing power through its monetary and fiscal policies. If purchasing power is curbed manufacturers find it more difficult to raise prices and the bargaining power of unions may be reduced. In the 1950s the Government relied heavily on fiscal and more especially monetary policies the nature of which will be examined in later sections. The main danger is that curbing purchasing power is likely to curb the rise in output and productivity so that attempts to control the wage price spiral in this way could result in the stagnation of the economy. Furthermore there is a danger that some wage increases will continue in periods of stagnation so that inflation cannot be entirely avoided.

It is clear that there is no easy solution—there

are difficulties and disadvantages attaching to every possible measure for controlling price inflation. In Part IV we shall discuss the solutions which have been attempted in the 1960s.

4 MONEY, BANKING AND FINANCE

The Radcliffe Report

In September 1957 the Chancellor set up the Radcliffe Committee to report on the working of Britain's monetary institutions. The report of the committee published in 1959 contains a detailed description of the monetary institutions of this country and a systematic appraisal of monetary policies in the 1950s. It is complicated because the monetary system is complicated but it is written in terms which can be understood by the layman. Any reader who finds the following account inadequate should consult it.

Money

In Britain money consists of bank notes, coin, and banks' debt. Bank notes—mainly in denominations of £10, £5 and £1—are issued by the Bank of England, which has been publicly owned since 1946 and which acts in effect as an agent of the Government. We shall see below (§21(L)) how commercial banks can also create money.

The total size of the bank note issue is not a good guide to the amount of purchasing power in the economy. The Bank of England stated in its evidence to the Radcliffe Committee that it was now its policy to issue bank notes in accordance with the convenience of the public and not to use this means of controlling the amount of purchasing power. As a result, the various checks on the size of the note issue—in particular the traditional monetary control over the fiduciary issue and the permitted maximum level of the note issue—have become functionless and may be ignored. An increase in the value of the note issue is now only a symptom and not a cause of inflation.

Determination of Income and Employment

What matters is the amount of purchasing power available to the public. Most private expenditure is financed out of income—after paying taxes—and most government expenditure out of taxes, but most investment, public and private, and a growing amount of purchases of durable goods by consumers is not financed out of income but out of borrowing of one kind or another. And the primary purpose of monetary policy must be to keep the total of this kind of expenditure out of credit in line with the amount of savings by private individuals and profit-making companies are prepared to make out of their incomes. For if such investment expenditure exceeds the amount which the community wishes to save out of its current level of income it means that the total demand for goods and services exceeds total current output. If output cannot be increased because men and machines are already fully employed, prices and wages and also imports are forced up in response to the demand. If on the other hand investment expenditure falls short of saving out of full employment income, production and employment are reduced below the full employment level.

There is no automatic mechanism in our economic system which ensures full employment of resources and it is the task of Government to balance savings and investment at the right level of employment. This important fact was first established by the great economist J. M. (later Lord) Keynes. Prior to the Great Depression economists believed that any divergence from full employment was a temporary phenomenon which would right itself. However in the 1930s Keynes produced a new explanation of how income and employment are determined, and so brought about what has come to be known as the *Keynesian Revolution* in economics.

Government Control of Income and Employment

The Government can control the level of income and employment in various ways. First in many fields the Government has only very restricted powers to influence behaviour. It

cannot compel persons or companies to save it can only offer them inducements to do so in the form of higher interest rates or of tax concessions on receipts from interest and their effectiveness is limited. Nor in general has it very much direct power over expenditure out of credit. It can and does control the conditions under which hire purchase agreements are made—and this does temporarily at any rate make a great deal of difference to the amount of goods bought on hire purchase. It can to a certain extent influence private companies in their investment policies by granting and withdrawing incentives to investment (see G13(1)) but it is doubtful quite how much influence these changes have. And it can if it chooses exercise direct control over building by allowing building only on licence. This power however is not now used in order to control the level of investment but only in order to encourage it in depressed areas and discourage it elsewhere. The only authorities over whose investment the Government does have real control are the nationalised industries and as the Radcliffe Committee pointed out there are obvious disadvantages in any system whereby investment in public utilities is determined not by the need for such investment but by the need to balance savings and investment.

The two main means remaining are fiscal and monetary control. If the Government thinks there is going to be a shortage of private savings it raises more in taxation or reduces its current expenditure and so increases the Budget surplus (see G24(2)). The second form of control is much more complex in principle the aims are twofold. One is to keep the amount of credit creation down (or up) to the required extent the second is to ensure that the Government gets the share of savings it needs to cover its investment programmes. The complexity arises from the interrelations between these two tasks.

The Government as Borrower

The Government is a heavy borrower from the rest of the economy. In 1965 total public borrowing—by government nationalised industries and local authorities—stood at £38 000 million equivalent to 1.4 times the annual national income. Most of this immense National Debt was built up during the war when government expenditure far exceeded taxation but the total continues to advance year by year owing to the heavy capital requirements of the nationalised industries.

The Government borrows in six main ways. First the issue of bank notes is in effect a form of government borrowing. Second it borrows from foreign governments. Third it borrows from companies through tax reserve certificates which are a means by which companies let the Government have the taxes they would have to pay on profits as the latter are earned rather than when the taxes legally become due. Fourth it borrows direct from private individuals through the various forms of national savings. In all forms of national savings the Government pays interest—or in the case of premium bonds prizes in lieu of interest—to the winners of the monthly draw—to the holders who have the right either on demand or at short notice to the repayment of their loans.

Gilt edged Securities and Treasury Bills

The fifth and sixth methods of borrowing are through the market. The main method is through the Stock Exchange by the issue of fixed interest securities called *gilt-edged securities*. In 1965 the net amount owing to the public on all such securities was nearly £18 000 million, a third of total public debt. Most gilt-edged securities are promises to repay at a specified date in the future the amount originally borrowed, and in the mean time to pay a fixed amount of interest each half year. Some gilt edged securities are irredeemable and consist therefore simply of a promise to pay the interest in perpetuity.

Most gilt-edged securities are held by institutions the banks, discount houses, and other major financial institutions of the country and foreign governments (whose holdings represent their sterling balances (see G7(9))—only a fifth of the total being held by private individuals. Gilt-edged securities unlike national savings are not

liquid assets. Until they become due for replacement they can only be sold on the Stock Exchange for what they will fetch and variations in their market value are quite considerable. Dealings in second hand securities can have important effects on the economy. Variation in the market price of securities implies an inverse variation in the effective rate of interest which they earn. This in turn can influence the general level of interest rates hence the amount of investment which it is profitable to carry out and hence the general level of economic activity.

The sixth form of borrowing is by means of *Treasury Bills* of which £2 100 million were outstanding in 1965. A Treasury Bill is an extremely short term loan to the Government—usually for three months. Each week the Treasury offers for sale some £300 million of these and a number of specialised institutions bid for them. The difference between their bids and the value of these bonds on repayment is called discount and is a substitute for interest. These bills play a crucial role in the monetary system for it is by affecting the rate of discount on Treasury Bills that Bank Rate influences monetary conditions in the economy but more of that a little later.

Government Borrowing and Liquidity

Monetary policy consists largely in varying the way in which the Government borrows to finance its expenditure. This is because the form of borrowing affects the amount of *liquidity* in the economy. All financial institutions have some policy regarding liquidity. In general they try to maintain sufficient reserves either of cash or of assets which can be immediately converted into cash to meet any foreseeable sudden increase in their commitments. But they do not hold all their assets in liquid form. The chance that all their creditors simultaneously demand their money back can be ruled out and therefore most of them act on the principle that they should maintain cash or other liquid assets to cover some percentage of their total outstanding commitments. Whereas currency and Treasury Bills are regarded as liquid assets government securities and most other forms of government borrowing are illiquid.

If therefore the Government borrows more by issuing currency or Treasury Bills and less by other means this action increases the amount of liquid assets about and therefore the total lending which financial institutions think it safe to make. And conversely if the Government borrows less by issuing currency or Treasury Bills and more by other means this tends to decrease the total amount of loans which financial institutions are prepared to make. However government control over the way in which it borrows is circumscribed. The public can be persuaded to hold more government securities only if the rate of interest earned on securities is increased. In the 1950s the British Government was unable to prevent a rapid accumulation of short-term debt even though it allowed the rate of interest earned by irredeemable government securities to rise from less than 4 per cent in 1950 to over 6 per cent in 1960.

The Commercial Banks

In the centre of the financial world stand the commercial banks. In England these are known as the London clearing banks. In this country unlike the United States the banking system is highly concentrated there being five main banks with branches in every town. The commercial banks are important because their debts are used by the public as money. Anyone who has a bank current account can sum cheques or withdraw cash on demand up to the limit of his account. Because they can be used as a means of payment just as readily as bank notes bank deposits are money.

Commercial banks earn a profit by borrowing funds and then lending part of these funds at higher rates of interest. Because it is unlikely that all deposits will be withdrawn at once the banks hold only a small proportion of their deposits in the form of cash. The Bank of England requires them to hold 8 per cent and we see in the table that in 1965 the average cash ratio was

LONDON CLEARING BANKS 1965
(£ million)

Liabilities		Assets		Percentage of deposits
Capital and reserves	513	Cash	739	8.2
Deposits	8 989	Other liquid assets	2 042	22.5
Other	542	Special deposits	56	0.6
		Investments	1 087	12.1

8.2 per cent. In addition they hold by convention liquid assets (Treasury bills and money at call and short notice) equal to at least 28 per cent of their deposits, the ratio being 30.7 per cent in 1965. These liquid assets are easily transferable into cash. Their remaining assets are more remunerative, the majority being advances made to the public and earning a rate of interest higher than Bank Rate. In 1965 cash held by the commercial banks amounted to £739 million, whereas the public had deposits with the banks totalling £8 989 million. Thus the banking system can create money, it does so by accepting bank deposits far in excess of the cash held to meet demands for these deposits.

The Control of Commercial Banks

The first step in any credit squeeze is to put pressure on the commercial banks by reducing their liquidity, so causing them to restrict their advances to would-be investors. This can be done in two main ways. The first is by *open market operations* in which the Bank deliberately sells more government stock than it otherwise would. The purchasers pay by cheque and thus create a debt from the commercial banks to the Bank of England. Such debts have to be settled in cash and so pressure is put on the banks' liquidity. The second is *Bank Rate*. If Bank Rate is raised it has the immediate effect of raising the rate of discount on Treasury Bills. A high rate of discount on these makes them appear attractive investments to those who do not normally buy them and the commercial banks find it difficult to get as many of them as they would like. So again there is pressure on the banks' liquidity.

Faced by such pressure, the banks have to take steps to restore their liquidity either by selling securities or by calling in advances. Neither method brings in much cash directly, for since the banks will be paid by cheque rather than in cash they have to go on until the depletion of deposits caused by the paying of these cheques cuts down the total of deposits to the level where liquid assets once again represent 30 per cent of the total. To this there is one major exception: if the Bank of England buys the securities the banks sell—and the need to ensure an orderly market may force it to do so—then selling securities brings more cash into the banks and thus enables them to replenish their liquidity.

Since 1958 the monetary authorities have had the power to call upon the banks to make *special deposits* in cash with the Bank of England. Unlike other deposits of the banks with the Bank of England, special deposits cannot be treated as forming part of the liquid assets of commercial banks. This is in effect another way of putting pressure on the liquidity position of banks, the necessity of making such deposits could force them to sell securities or reduce advances. Special deposits amounted to 0.6 per cent of the banks' total deposits in 1965.

Bank Advances and Other Credit

Bank advances are the simplest of all forms of credit: the customer is just given the right to sign cheques beyond his credit account and interest is charged on the overdraft. In the late 1950s a new form of advance—the *personal loan*—was introduced by some banks. These are granted to customers who would not earlier have been

regarded as credit worthy. A higher rate of interest is charged than on ordinary overdrafts and more specific rules about repayment are laid down.

Most advances however are made to business, particularly to small business and to farmers. In business the common practice is to finance working capital—stocks and work in progress—out of bank advances and to depend on more permanent forms of borrowing for the purchase of fixed capital. But there are no fixed rules: business gets its finance wherever it can and in fact there is such a variety of ways in which it can get capital that a squeeze on bank advances alone is not as effective as might be expected. Big businesses in practice scarcely suffer at all for they are in the best position to tap other sources of credit. Quite a good example is provided by the hire purchase finance companies. During the credit squeeze of 1956–58 the banks were asked by the Chancellor of the Exchequer to hold down advances and in particular not to increase advances to hire purchase finance companies. They did so, but the companies had no difficulty in getting the money they needed by borrowing direct from the public at high rates of interest. The real sufferers tend to be small businesses and professional people who do find it hard to obtain credit elsewhere, but even they may be able to do so for instance by taking out a mortgage on their property or by buying their equipment on hire purchase where previously they had paid cash or by cashing some national savings.

The Radcliffe Committee discussed at length how effective a squeeze on the banks was likely to be and in general their conclusion was that it was not likely to be very effective because most borrowers would usually find other sources of credit. The other sources would usually be more expensive but they thought this mattered very little, as interest payments form only a small part of most business costs except in very highly capitalised industries, most of which are now publicly owned. Interest does matter in housing: the monthly interest payments due on a mortgage to a building society can go up substantially when the rate of interest goes up, although usually for existing as opposed to new mortgages no more money is asked for, instead the term of the mortgage in years is extended. But in hire purchase where service charges far exceed the interest element in any loan, interest is of trivial importance.

The Stock Exchange

The banks through their advances are the main providers of short term credit, but most long term credit is provided through the Stock Exchange. In 1965 the total market value of all securities traded on the Stock Exchange was £75 000 million, of which £57 000 million represented stocks or shares in public companies. There are three main types. *Debenture Stock* is simply a fixed interest loan. *Preference Stock* is a fixed interest loan with provisions for waiving the interest if the company fails to earn profits. Preference shareholders cannot get a company declared bankrupt if it does not pay them a dividend but Debenture holders can. The third type—and much the most important—is *Ordinary Shares*. Normally the owner of an Ordinary Share is a part-owner of the company concerned with most of the rights of ownership. He has no right to any particular dividend or interest pay

ment but only the right to participate in net profits if there are any. In addition to stocks or shares in public companies, British Government gilt edged securities worth £15 000 million were quoted on the Stock Exchange.

The Return on Financial Assets

Each type of holding has obvious advantages. The fixed interest security brings in a guaranteed income. The Ordinary Shareholder has no such guarantee though in practice during the post war period the risk of a decline in dividend was small. In a time of inflation the risks attached to holding fixed interest securities are in some ways greater than those attached to holding Ordinary Shares for while Ordinary Shares appreciate in market value when there is inflation, fixed interest securities tend to fall in market value because the Government is forced to increase interest rates as an anti inflationary measure. Furthermore in the long run the growth of the economy tends even without inflation to raise the value of Ordinary Shares by increasing the value of companies. And lastly for investors who pay tax at heavy rates on their incomes—and most large personal investors in the Stock Exchange are rich people—capital gains are worth more than income in dividends. So for private investors the Ordinary Share was a much better bet in the 1950s and because Ordinary Shares were so popular the yield on such shares—the ratio of dividends to market value—fell below the yield obtainable on Government securities (see table).

PERCENTAGE YIELD ON FINANCIAL ASSETS

	Bank Rate (range during year)	Treasury bill rate	Irredeemable government bond rate	Ordinary Share rate
1950	2	0.5	3.5	5.3
1955	3-4.5	3.6	4.2	5.4
1960	4-6	4.9	5.4	4.6
1965	6-7	5.9	6.4	5.5
1969	7-8	7.6	8.9	3.9

Most Ordinary Shares are held by private individuals but increasingly in recent years holdings by insurance companies and pension funds have become more important. Because of the growth of private superannuation schemes insurance companies and pension funds cannot afford to take risks so the main bulk of their funds is still invested in fixed interest securities but they have shown a growing tendency to increase the proportion of their funds invested in Ordinary Shares. This switch by lowering the demand for gilt edged securities relative to Ordinary Shares contributed to the downward pressure on the prices of gilt edged securities. Legislation was introduced in 1960 to permit trusts to invest up to 50 per cent of their funds in the Ordinary Shares of large companies. In the same way this has depressed the yield on Ordinary Shares and raised the yield on gilt edged.

Historically the greater security of gilt edged holdings has normally been reflected in lower yields. If inflation is controlled, or if the prospect of industrial expansion becomes less bright, the demand for gilt edged may increase and that for Ordinary Shares decrease and the normal pattern of yields may then return.

Survey of Monetary Controls.

The post war Labour Government pursued a cheap money policy. There was no major use of monetary policy as an economic regulator. Bank Rate for instance was kept at 2 per cent throughout and the rate on Treasury Bills was only 1 per cent. Instead the Government relied on controls and on fiscal measures to keep inflation in check. For this neglect of money controls there was in fact a very good case. The pent-up demand for goods was so strong and the funds available to companies and individuals so large that monetary restrictions would not have made very much difference. The Conservative Government reintroduced monetary policy in 1951. Bank Rate was raised—reaching a peak in 1957—

and manipulated in an attempt to control demand. This policy was adhered to by both Governments in the 1950s. We see in the table that the rate on Treasury Bills has kept in line with Bank Rate.

In addition to influencing the cost of credit by manipulating interest rates the Government influenced the availability of certain sorts of credit through the credit squeeze. At times it made it more difficult for the banks to extend their lending by operating on the banks liquidity position and it also issued more or less strongly worded requests that banks should restrict growth of or secure a reduction in their advances.

A form of monetary control which was particularly important after 1950 was the control of hire purchase. By increasing or lowering the proportion of the price which has to be paid as a down payment and by reducing or lengthening the time over which repayments can be made the Government was able greatly to influence the volume of hire purchase transactions and therefore the use of this particular form of credit. These controls of course only affect the rather narrow class of goods—cars, furniture, washing machines, television sets etc.—for which a substantial proportion of sales are on hire purchase terms. In consequence the output of these industries concerned with the manufacture of these goods fluctuated widely.

The Effectiveness of Monetary Controls

Running through the Radcliffe Report is a scepticism concerning the likely general effective-

ness of monetary policy both as an anti deflationary and an anti inflationary weapon of control. In the former case it is clearly difficult to encourage spending by making credit more easily available if business prospects are so poor that no investment looks profitable. In the latter case the Committee concluded on the use of monetary policy to counter inflation in the 1950s (para. 469).

The obstructions to particular channels of finance have had no effect on the pressure of total demand but have made for much inefficiency in financial organisation.

They went on to add (para. 472)

We are driven to the conclusion that the more conventional instruments (*eg* Bank Rate) have failed to keep the system in smooth balance but that every now and again the mounting pressure of demand has in one way or another (generally *via* the exchange situation) driven the Government to take action and that the quick results then required have been mainly concentrated on the hire purchase front and on investment in the public sector which could be cut by administrative decision. The light engineering industries have been frustrated in their planning and the public corporations have had almost equally disheartening experience. It is far removed from the smooth and widespread adjustment sometimes claimed as the virtue of monetary action, this is no gentle hand on the steering wheel that keeps a well driven car in its right place on the road.

However the Radcliffe Committee did recognise that monetary measures have influenced confidence in sterling. A rise in interest rates increased the attractiveness of holding sterling balances and stern monetary measures were taken as indicative of the Government's intention to solve its problems without recourse to devaluation.

tion. In these ways monetary policy has helped to stem speculative outflows of sterling balances which threatened to impose heavy strains on our reserves. Many commentators feel that the effects provide an important justification for the use of certain forms of monetary controls.

The late 1960s saw a revival of belief in the efficacy of monetary policy (see G40).

5 ECONOMIC ASPECTS OF THE PUBLIC SERVICES

The Cost of Public Services

In 1965 total public expenditure was no less than £14 055 million about £280 per head. Of this total the central government spent over 60 per cent, the local authorities under 30 per cent and the nationalised industries investment programme was responsible for 10 per cent. Total public expenditure almost doubled between 1955 and 1965 and rose as a proportion of the national income from 46 to 50 per cent.

ing expenditure consists of two quite different items. The first housing subsidies is a recurrent cost and represents the difference between the cost of housing including the cost of borrowing and rents received on council housing. In 1965 costs exceeded the rents of £324 million by £149 million so that the average council house tenant was paying just under 14s in the £ of the cost of accommodation. Up to 1957 the Government contracted to pay a flat subsidy per year on every council house built. From 1957 Government subsidies were no longer paid on ordinary new council houses but in 1961 were reintroduced in a form intended to encourage councils to charge higher rents on their existing houses. The Labour Government substantially increased the subsidy in 1967, it being calculated as the difference between interest payable on new housing at current interest rates and at 4 per cent.

The other part consists of the capital cost of building new houses £628 million in 1965. This is financed out of borrowing by local authorities. In the early 1950s local authorities were able to borrow from the Government but they have been

THE COST OF PUBLIC SERVICES
(£ million)

	1955	1965	Percentage increase 1955-65	Percentage of total 1965
<i>Expenditure</i>				
Defence	1 567	2 121	35	15.1
Housing	532	934	76	6.6
Environmental services	240	556	132	4.0
Roads transport and communication	352	1 005	186	7.2
Education	549	1 567	185	11.1
Child care school meals milk and welfare foods	103	173	68	1.2
National Health Service	579	1 269	119	9.0
National Insurance pensions and assistance	993	2 413	143	17.2
Agriculture	188	336	79	2.4
External relations	185	423	217	3.0
Police and prisons	101	247	145	1.8
Debt interest	907	1 457	61	10.4
Other expenditure	842	1 549	84	11.0
Total expenditure	7 088	14 055	98	100.0
<i>Revenue</i>				
Income taxes	2 287	4 016	76	28.6
Indirect taxes	2 177	3 766	73	26.8
of which drink	369	538	51	4.4
tobacco	656	994	52	7.7
Local rates	475	1 230	159	8.8
National Insurance and health contributions	594	1 685	184	12.0
Other revenue	1 472	2 124	44	15.1
Total revenue	7 005	12 821	83	61.2
Net borrowing	83	1 234	—	8.8
Total expenditure	7 088	14 055	98	100.0

The Government collects in revenue considerably more than it spends itself but transfers funds to the local authorities, to the National Insurance Fund and to the nationalised industries. The expenditure of the public sector as a whole generally exceeds its revenue and the difference is met by net borrowing.

A breakdown of public expenditure is shown in the table. Not all categories of expenditure expanded at the same rate: expenditure on roads, transport and communication, education, external relations and National Insurance pensions and assistance increased faster than the total and expenditure on defence, debt interest, child care, the agricultural subsidy and housing fell behind the total. Nevertheless defence expenditure accounted for 15 per cent of the total (£ 7.5 per cent of national income) in 1965.

Public Housing

Expenditure on public housing amounted to 6.6 per cent of public expenditure in 1965, this percentage having fallen over the decade. Housing

increasingly forced to borrow from the market. The two policies of freezing subsidies and making borrowing more difficult have slowed down the expansion of council housing. In 1965 the peak year councils built 245 000 houses, in 1960 only 128 000 and in 1965 165 000. Private building has exceeded council building since 1959 and in 1965 council building represented only 40 per cent of the total.

Education.

Educational expenditure rose by no less than 185 per cent between 1955 and 1965 and accounted for just over 11 per cent of public expenditure in 1965. A small part of the increase is explained by the expansion of enrolment: total school enrolment in Britain increased by only 7 per cent over the decade. In addition, expenditure rose because the more expensive types of education—secondary schools and universities—expanded more rapidly. University enrolment increased by 60 per cent over the decade but the enrolment of 157 000 students in 1965 still did

not meet the demand for higher education. Secondary school enrolment also shot up: pupils of school leaving age (15 or over) as a percentage of the age group 15-19 nearly doubled in England and Wales. Nevertheless this proportion was only 19 per cent in 1965. Therefore it is to be expected that expenditure will continue to increase rapidly in the future.

However quantitative expansion is not enough: there is general recognition that qualitative reform is also needed. It is important to reduce the size of classes—there were on average 29 pupils per teacher in primary schools and 13 in secondary schools in 1965—but these averages cover a wide dispersion. To raise the school leaving age to 16—scheduled for 1972—to get rid of the Joint Board Schools inherited from the Victorian era and to raise teaching standards by improving the conditions for recruitment of teachers.

It is increasingly recognised that education can be an economic investment for the future just as much as capital formation in say machinery or roads. There is a private return on investment in education which takes the form of higher earnings over the lifetime of the person educated and there is a social return on public resource devoted to education being the greater contribution to the national product which trained and educated people can make.

Social Security

Social security benefits come from two sources. The largest part (£1 750 million in 1965) is paid out of the National Insurance and Industrial Injury Funds. These funds are built up largely out of the compulsory weekly National Insurance contributions which most of the adult population have to pay. For employees both employer and employee pay a contribution in return for which employees receive rights to pensions, sickness unemployment and other benefits. The self-employed also pay contributions of smaller size than the sum of the employer and employee's contribution and are not entitled to unemployment and one or two other benefits. And most non-employed persons other than married women and the retired have to pay still lower contributions and are entitled to even fewer benefits. Weekly contributions include a contribution to the cost of the National Health Service.

The most costly benefit is the retirement pension. The pension is paid as of right on retirement. Individuals may increase their rate of pension by staying on at work after the minimum leaving age of 65 for men or 60 for women, but the number who do so for more than a year is small—hardly but probably not mainly because most private superannuation schemes lay down a fixed retiring age. Supplementary benefits on the other hand are given on proof of need. The high incidence of supplementary benefits—no less than 2.7 million persons received supplementary benefits in 1969 of whom 1.7 million were old age pensioners—shows that national insurance benefits are often inadequate. It was partly to improve the pensions of those able to afford higher contributions that the scheme for graduated pensions was introduced.

The Finance of Social Security

The National Insurance Scheme is an odd mixture of insurance and tax. The levels of contributions when the scheme started in 1945 were fixed on the actuarial principle that contributions by or on behalf of an individual plus a specified State contribution should on average suffice to pay for the benefits to which he was entitled. But the scheme did not allow for inflation and a succession of increases granted in the rate of pensions has put an end to this actuarial probity. Whenever a bill is introduced to increase pensions the Government Actuary calculates by how much contributions should be raised in order that those who contribute throughout their working lives at the new rates would just earn their right to the new benefits—but the new rates of pensions are granted to all including those who have already retired. It was always expected that as the number of retired persons grew the fund would move into deficit but with each rise in pensions the estimated size of the future deficit has risen. The scheme for graduated pensions also had the objective of reducing this deficit.

Graduated Pensions

Under this scheme which affects only employees there are two kinds of workers—*ord nary* and *contracted out*. In the case of the contracted out workers their employer (on whom the decision whether to contract out rests) must institute a private superannuation scheme that gives at least as favourable terms as the new State scheme including the provision that rights under the scheme should be transferable up to the limits of the State scheme. Transferability is the guarantee that the individual does not lose his pension rights when he changes his job but one unsatisfactory feature of the private schemes that have existed has been their use to the employees to their jobs. For ordinary workers the contribution now depends on earnings. Those earning less than £9 a week pay a flat rate contribution which is lower than that paid by contracted out workers. Those earning more than £9 pay in addition a percentage of the amount by which earnings exceed £9 up to a limit of £18 and in return receive the right to an increased pension on retirement.

The scheme is devised partly to encourage private superannuation which is still largely confined to self-employed employees and employees of the State. But one purpose is clear—in return for a promise of higher pensions when they retire most workers who are contracted in pay more now and thus contribute now to the cost of the pensions of the retired. The estimated deficit is eliminated and indeed the principle is established that the basic rates of contributions should not be fixed on actuarial principles but on the principle that on balance benefits paid in a year should roughly balance receipts. No provision was made for automatically increasing pensions as the cost of living goes up or indeed as the average standard of living rises. All changes in rates of benefit still require a new Act of Parliament.

Public Revenue

We see from the table that of the sources of revenue local rates and National Insurance contributions were the most buoyant over the decade. Over 28 per cent of the total public revenue in 1965 came from income tax which was levied both on individuals and on the undistributed profits of companies. Indirect taxes on goods and services accounted for a further 27 per cent. It is interesting to note that direct and indirect taxation actually fell as a proportion of national income between 1955 and 1965.

Two commodities in particular were heavily taxed: drink and tobacco. Together they accounted for 12 per cent of public revenue. These commodities are singled out partly for social reasons and partly because—in economists' jargon—the demand for them is *inelastic* i.e. the public reduces its consumption of drink and tobacco only slightly in response to a rise in their price. In 1965 taxation increased the price of cigarettes by 2.3 times, drink by 0.7 times, consumer durables such as cars and washing machines by 0.2 times and food hardly at all. For goods and services in general tax raised the price by roughly a quarter.

The Budget

Each year in April the Chancellor of the Exchequer announces his Budget for the coming financial year. The most important and most difficult task in drawing up the Budget is to decide on the size of deficit to aim for. The deficit is the excess of public expenditure over public revenue and it has to be financed by borrowing from the private sector. A large deficit is inflationary sometimes that may be required to get the economy out of recession. A small deficit—and even more a surplus—is deflationary and is a means of holding an inflation in check.

The calculation of the precise deficit or surplus needed is a chancy business—for the level that is required depends on the amount of saving and on the amount of spending out of credit that people intend to do—and this is not easily predictable. It also depends on the change in the foreign balance. Nor can the Chancellor be sure his figures are right: estimating next year's revenue and even next year's expenditure by the Government is difficult enough but he needs to estimate

also the likely trends of private income and expenditure without really reliable information as to what they were in the past year. So it cannot be expected that fiscal policy alone can prevent inflation and deflation.

Nevertheless, fiscal policy—running large deficits when economic activity is low and small ones when it seems to be excessively high—is the most important action through which the economy can be kept on an even keel. Monetary policy may help, but the decision of the Chancellor on the size of his Budget surplus is the key one.

6 SOURCES OF STATISTICS AND SOME SUGGESTIONS FOR FURTHER READING

The non specialist will find that most of the statistics he needs are given in the *Annual Abstract of Statistics* published every year by Her Majesty's Stationery Office. This comprehensive document includes figures on population, social conditions, education, labour, production, trade and balance of payments, national income and expenditure, wages and prices and many other topics. For more up to date information reference should be made to the *Monthly Digest of Statistics* which has a similar coverage and gives month by month figures. A selection of the more important series, presented in a manner which can more easily be understood by the layman is given in another Stationery Office publication *Economic Trends* also issued monthly.

Even greater detail is given in various other Government publications e.g. in the Blue Book on *National Income and Expenditure* published annually and the *Balance of Payments White*

Paper published twice a year. Fuller information on labour problems is given in the *Employment and Productivity Gazette* on trade in the *Board of Trade Journal* and on financial matters in the *Bank of England Quarterly Bulletin*. These three periodicals include discussion on the statistics presented. An important new Government annual publication in 1970 was *Social Trends* containing articles and detailed statistics on social and economic conditions in Britain.

For an analysis of developments in the economy see the official *Economic Report* published just before the Budget by the Treasury and the *Economic Paper*, a private publication issued by the National Institute for Economic and Social Research. To explain economic events and policy the Treasury publishes a monthly *Press Report* available free of charge to the public.

For a scholarly critique of Government economic policy see J. C. P. Dow, *Management of the British Economy 1945-60* (Cambridge University Press). An excellent North American survey of the British economy is found in the Brookings Institution Report *Britain's Economic Prospects* edited by Richard F. Caves (George Allen and Unwin). An entertaining account of economic ideas and their application is found in Michael Stewart *Keynes and After* (Penguin Books). Other Pelicans include Joan Robinson on *Economic Philosophy* and J. Pen *Modern Economists*. A thorough explanation of international monetary affairs is given in Fred Hirsch *Money International* (Allen Lane). E. J. Mishan in *Growth: The Price We Pay* (Staples Press) produces an interesting criticism of economists and politicians' obsession with economic growth and affluence.

III THE UNDERDEVELOPED ECONOMIES

Income Levels

Two thirds of the world's population live in dire poverty—a poverty which can scarcely be imagined by those accustomed to the standards of living attained in the relatively few developed countries of the world. The orders of world inequality may be seen from the table comparing annual income per capita by region converted into pounds sterling at official exchange rates.

NATIONAL INCOME PER CAPITA
BY REGION 1963

	(£ p a)
North America	882
Oceania	443
Europe	350
Latin America	107
Middle East	93
Africa	43
Asia (excl. Japan)	36

These figures are only very approximate because exchange rates are misleading indicators of purchasing power and because the averages conceal considerable income inequalities within some regions and countries. Nevertheless it is clear that poverty is widespread in the world. The alleviation of this poverty is widely recognised as the most important economic—and indeed political—task of the second half of the twentieth century.

Peasant Agriculture

Underdeveloped (or developing or less developed or poor) countries have predominantly agricultural economies and peasant subsistence agriculture is widespread. In subsistence agriculture the primary object is to produce the food for your own family. Primitive tools and techniques of cultivation are used and the margin between what can be produced and what is required to support life is narrow. The failure of crops because of drought or the destruction of crops by floods or pests can lead to famine unless food is quickly supplied from outside the area affected.

Agricultural production may be kept down by a shortage of land or by a lack of farming knowledge and skills or by a lack of funds for investment in land improvements or machinery or by an unjust system of land tenure which deprives the farmer of incentive to raise his production. In many underdeveloped countries there is considerable potential for increasing agricultural output, but before such increases can be achieved new skills have to be mastered and different techniques of production introduced, investment funds have to be provided and—in some countries—there must be land reform. If power lies in the hands of landlords and money lenders who favour the *status quo* political change must come first.

The Population Problem

In many underdeveloped countries there is population pressure on the land and much underemployment in the sense that people have insufficient work to keep them occupied for more than part of the day or year. With the application of modern methods of disease control—the eradication of malaria through DDT spraying—death rates have tended to fall while birth rates have remained high. Birth rates are kept up by such factors as tradition, social prestige, religion, the need for security, old age and lack of facilities for family planning. In consequence many underdeveloped countries are experiencing an unprecedented population explosion, annual rates of increase of between 2 and 3 per cent which double population in as little as 35 and 24 years respectively have been recorded.

The table indicates that over half of the world's population lives in Asia and that the developed regions account for under a third of the total. Apart from Australasia (into which immigration is high) the developed regions show slower rates of population growth than Africa, Latin America and Asia. The figures of population density may easily be misinterpreted since they take no account of the nature of the area, e.g. deserts and lakes are included. But it is clear that Asia is more densely populated than Africa or Latin America. Population density is a hindrance only in agricultural economies because it is industrialised and has accumulated much capital. Europe can support at a high standard of living a population more concentrated even than that of Asia.

POPULATION SIZE GROWTH AND DENSITY BY REGION

	Popula- tion 1968 (m)	Growth rate 1960-68 (% p a.)	Density 1968 (per sq km)
North America	809	1.8	13
Europe	455	0.9	92
USSR	238	1.3	11
Oceania	19	2.1	2
Africa	386	2.4	11
South America	180	2.7	10
Asia	1946	2.0	71
World Total	3483	1.9	26

As a result of rapid population growth the pressure of population on the land has increased particularly in Asia. Less productive land has been brought into cultivation and erosion and loss of fertility have become major problems. A substantial increase in output is required to prevent a fall in per capita income as population grows and an even greater increase is required if living standards are to be improved. Between 1960 and 1967 food production in the developing countries as a group increased by 20 per cent but per capita food production rose by only 1 per cent. Even in those countries with plenty of land a rapid increase in population diverts scarce investment resources away from directly productive investments such as factories and irrigation projects so as to meet the needs of the expanding population for more schools, hospitals, housing, cities and other public services.

International Trade

Almost all underdeveloped countries export primary products (foodstuffs, industrial raw materials and minerals) and import manufactured goods—especially the capital goods (plant, machinery and vehicles) required for development. This international division of labour has recently operated to the disadvantage of the underdeveloped countries. The world demand for their primary products has increased only very slowly. This is because people spend just a small part of their additional income on food (e.g. tea, coffee, cocoa) because synthetic substitutes have been developed for many raw materials (e.g. rubber, cotton, jute) because developed countries protect their own agriculture (e.g. sugar) and because demand in the developed countries has moved towards commodities with low raw material content (e.g. from heavy industries to services). In consequence the general trend has been for the prices of primary products to fall. This was an important cause of the improvement in Britain's terms of trade (see G6). The reverse of the coin was a deterioration in the terms of trade of many underdeveloped countries as they could now buy fewer imports for a given quantity of exports. Primary commodities exported by developing countries decreased in price on average by 15 per cent over the period 1957-62 and increased by only 4 per cent between 1962 and 1968. Over the period 1957-68 their terms of trade worsened by 12 per cent. This contributed to the shortage of foreign exchange which restricts investment expenditures in many underdeveloped countries.

The prices of various primary products tend to fluctuate violently from one year to another. Many underdeveloped economies depend heavily on the exports of one or two commodities. For instance, coffee is the most important product in Brazil, cotton in Egypt, copper in Zambia, sugar in Cuba, cocoa in Ghana and rice in Burma. Fluctuations in the world price of its main export cause instability in the export revenues of a country and this in turn can produce fluctuations in income throughout its domestic economy.

Industrialisation

In those underdeveloped countries where there is population pressure on the land, alternative employment has to be created in industry or

services. Even in countries with a surplus of land if there is heavy dependence on one or two primary products, industrialisation provides a means of diversifying the economy.

But industrialisation is not an easy course. Because the margin between agricultural production and food consumption is narrow, the surplus from the agricultural sector exchangeable for the products of other sectors—e.g. industry and services—is small, i.e. the demand for the goods and services produced by other sectors is low. A second constraint on industrialisation is imposed by competition from a broad new industry in an underdeveloped country have to compete with established industries in developed countries which have the advantage of experience, a trained labour force and markets big enough for them to reap all the potential economies of large scale production. On the other hand, underdeveloped countries with their relatively cheap labour may have an advantage in the production of simple labour intensive products, witness the success of Hong Kong in exporting textiles and plastic products to the developed countries.

Underdeveloped countries can of course take advantage of the technical advances made in the developed countries. But this is not without its drawbacks. Even in countries with cheap labour the most profitable techniques of production in industry are normally highly capital intensive so that the amount of investment funds required to equip a worker is often enormous and the amount of employment provided in meeting the local demand for a manufactured product is often small. Hence the argument for developing an *intermediate technology* which is both profitable and suited to the needs of the underdeveloped countries.

Educated Manpower

Many underdeveloped countries are faced with the dual problem of unskilled labour surpluses and scarcities of skilled and educated manpower. The problem is particularly acute in some of the recently independent countries of Africa. To give an extreme example, at the time of its independence in 1964 Zambia had only 100 Zambian university graduates and 1 200 secondary school graduates in a population of 3.5 million. In such countries the great shortage of educated and skilled people enable them to earn high incomes—with the result that there is a very unequal distribution of income. And even in countries where surpluses have developed the existence of an international market for professional people like doctors and engineers helps to keep up their earnings; these countries suffer from a brain drain to the developed world.

Because teachers are educated people, education in underdeveloped countries can be very expensive. In Uganda in 1965 only 45 per cent of the children in the relevant age group were at primary school and only 2 per cent were at secondary school. Yet the salary bill paid to their teachers exceeded 2 per cent of the gross domestic product. In such circumstances it is difficult to meet the demands for universal primary education, especially if the sort of primary education provided does not enable children to become better farmers.

Economic development is not just a matter of capital accumulation. It requires also an increase in educated manpower. Not only more knowledge but also new habits and attitudes—e.g. attitudes towards risk taking, hard work and thrift. Education—of the right sort and with suitable content—is generally acknowledged to be important for development although the benefits of education cannot be quantified at all satisfactorily.

Economic Aid

The gap between living standards in the underdeveloped areas of the world and in the areas already developed has tended to widen in recent years. In the 1950s real income per capita rose in the developed countries by 2.7 per cent per annum on average and in the underdeveloped countries by 2.3 per cent per annum. It was through a growing world recognition of this situation that the 1960s were designated 'The United Nations Development Decade'. But

between 1960 and 1968 these rates of growth widened to 4.0 and 2.3 per cent per annum respectively. World inequalities increased despite a larger flow of economic assistance from the richer to the poorer nations. The total net flow of economic assistance from Western industrial countries to the developing world was over £3,600 million in 1969. Roughly £2,600 million of this was net private investment and £3,000 million official Government aid. But whereas total aid increased rapidly in the 1950s the increase was not continued in the 1960s: total aid in 1966 was no higher than the estimate for 1961. Almost half of the official Government aid in 1969 was contributed by the United States; the other principal donors were France, West Germany, Japan and Britain in that order.

Aid to underdeveloped countries takes many forms: it serves many purposes and it is given for many reasons. Underdeveloped countries need aid to provide finance for development, projects to provide foreign exchange with which imports for development purposes can be bought, and to provide the trained manpower and technical knowledge which they lack. The motives of the donor are not always humanitarian. Aid can take a military form: it can be used to prop up an incompetent or unjust government or to buy support in the cold war. Nor is aid always beneficial to the recipient country. It may be wasted on ill conceived or prestige projects or cause the Government simply to relax its own efforts. Sometimes schools or hospitals are built with aid but there is a lack of local revenues with which to staff and run these institutions. Concern over donors' motives and instances of waste has led some people to react against aid giving. However the correct remedy is not to cut off aid but rather to prevent its misuse.

One form of aid is private investment by firms and individuals from developed countries. These investments—setting up branch factories for example—are concentrated in those projects which appear profitable to the investor. However it is a characteristic of underdevelopment that there are few openings for profitable investment. Most of the U.K. private investment overseas for example has been concentrated in relatively highly developed countries of the sterling area. Private investment cannot be relied upon to provide an adequate flow of aid.

Donor governments may finance specific projects or they may contribute to the general pool of funds available for expenditure by the governments of underdeveloped countries. But financial aid is not always enough. Most underdeveloped countries need help and advice in planning their development, to ensure that development possibilities are exploited and that scarce resources are used to best advantage. Hence the many schemes for providing experts by individual countries and by the technical agencies of the United Nations such as the Food and Agriculture Organisation (FAO), the World Health Organisation (WHO), the International Labour Organization (ILO), the United Nations Educational Scientific and Cultural Organisation (UNESCO), the Technical Assistance Board (UNTAB) and so on. Hence also the schemes for educating and training people from the developing countries in universities and colleges in the developed countries.

The International Bank

The International Bank for Reconstruction and Development (IBRD) known as the *International Bank* or as the *World Bank*, is an agency of the United Nations established in 1945. It has the primary function of making funds available to assist underdeveloped countries. Member nations agree to subscribe quotas—fixed in much the same way as the quotas for the IMF—to the Bank. In fact only a small proportion of the quotas has been called up by the Bank; the major part of the Fund's resources are borrowed—on the security of the remainder of the quotas—in financial centres particularly in New York but also in London and elsewhere.

Usually loans are made to finance specific projects of investment in underdeveloped countries and the Bank will normally make a loan only if it is satisfied that the investment will yield a revenue sufficient to enable the payment of interest on the loan and the repayment of the sum lent. In 1970 the Bank made loans to the value of about £700 million. Thus a sizeable amount of lending is channelled through the Bank, but it is clear that some projects of great value to underdeveloped countries cannot be financed in this way because they would not yield returns quickly or large enough to meet the Bank's stringent requirements for interest and repayment. Accordingly a new institution the *International Development Association* was set up in 1960 with the power to make loans at low rates of interest and with more generous repayment conditions. The IDA contributes (but only on a limited scale) towards the development of education and agriculture.

Unctad

In 1964 the United Nations Conference on Trade and Development (UNCTAD) was held. For the first time the poorer nations of the world—77 were represented—came together to act as a pressure group on trading matters. The Conference made the following recommendations. Developing countries should be given freer access to world markets for their manufactures and semi-manufactures by the elimination of quotas and tariffs. International commodity agreements should be made for each major primary commodity in world trade to stabilise commodity prices. Compensation schemes—whereby countries are compensated for the declining prices of their primary products—were recommended for consideration. The conference also resolved that the developed countries should aim to provide at least 1 per cent of their national income as aid for the underdeveloped countries.

Nothing concrete resulted from the 1964 Session: no significant trade measures in favour of the developing countries were taken and the international transfer of financial resources diminished in relation to the income of the developed countries. A second Session of the Conference was held in 1968. Again no action resulted from the Session, but the developed countries did accept more firmly the principle of discrimination in favour of developing countries in trade and shipping and the 1 per cent target for aid.

British Aid.

The table shows how British Government aid to underdeveloped countries has increased in

BRITISH GOVERNMENT AID 1957/8 TO 1969/70

Fiscal year	Total aid			Multi-lateral aid £m.	Bilateral Aid		
	£m	per capita £	as per centage of GNP		Total £m	Grants £m.	Loans £m
1957/8	65	1.3	0.33	3	62	50	12
1960/1	147	2.8	0.65	17	130	60	70
1963/4	173	3.2	0.64	15	158	72	87
1964/5	201	3.5	0.65	17	185	72	87
1965/6	205	3.3	0.68	19	186	83	94
1966/7	215	3.9	0.65	19	196	92	104
1967/8	213	3.9	0.61	24	189	89	100
1968/9	207	3.7	0.56	20	179	92	87
1969/70	217	3.9	0.56	24	194	83	111

recent years. It was fairly constant before 1957/8 but more than tripled to £213 million in the decade following 1957/8. Aid per capita of the British population nearly tripled and amounted to £3 18s per head in 1967/8. However when aid is expressed as a percentage of the gross national product (GNP) we see that the percentage increased from 0.33 of 1 per cent in 1957/8 to 0.65 of 1 per cent in 1960/1, remained at that level until 1966/7 and then fell. To be just 1 per cent of GNP aid would have to be raised by about £100 million. Aid may be divided into multilateral aid and bilateral aid. Multilateral aid is given through the medium of the international institutions such as the IBRD and the IDA. Bilateral aid is given directly to the developing countries. Multilateral aid was still only £24 million in 1969/70. The increase in aid since 1957/8 has taken place in bilateral aid. Whereas loans were fairly negligible in 1957/8 they increased rapidly and exceeded grants from 1964/5.

It must be remembered in deciding the terms on which Government aid is provided that the foreign indebtedness of the developing countries is increasing sharply. About four fifths of British loans is made available for 20 years or more. Normally the rate of interest on these loans is the rate at which the British Government can borrow on the capital market. However the Government decided in 1966 to make development loans free of interest in appropriate cases. About a third of expenditure on aid is formally tied to the purchase of British goods and services. Other aid is not tied formally and may be used directly to finance local expenditure, but when it is used to finance imports directly it has to be spent on British goods if these are available on competitive terms. Multilateral aid is untied. The tying of aid tends to raise the costs to developing countries, but it also enables countries with precarious foreign balances—such as Britain—to be more generous.

Aid takes the form not only of financial but also of technical assistance. To co-ordinate and promote technical assistance the Department of

Technical Co-operation (DTC) was set up in 1961. British Government expenditure on technical assistance amounted to £44 million in 1969. At the end of 1969 British technical assistance personnel overseas totalled altogether 12 000 (excluding volunteers recruited by voluntary societies) over 1 500 administrators, 5 000 teachers, 1 000 agricultural advisers, 3 000 industrial and technological advisers and 1 200 doctors and medical workers.

In 1964 the Labour Government established an Overseas Development Ministry (ODM) through which all British aid was channelled and co-ordinated, but in 1970 the Conservative Government absorbed the ODM into the Foreign Office. The amount of aid which ought to be provided has become a political issue in some countries such as the United States, thankfully this has not occurred in Britain.

Some Suggestions for Further Reading

For an introduction to the subject the reader is referred to Jagdish Bhagwati, *The Economics of Underdeveloped Countries* (World University Library). An interesting account of life in rural India is found in Kusum Nair, *Blossoms in the Dust* (Duckworth). On Asia the reader may wish to dip into the three volumes of Gunnar Myrdal entitled *Asian Drama: An Enquiry into the Poverty of Nations* (Alan Lane, The Penguin Press). A helpful introduction to African problems is found in Andrew M. Kamarck, *The Economics of African Development* (Praeger). The Overseas Development Institute has published a number of pamphlets on aid topics including *The Less Developed Countries in World Trade*, *British Development Policies and Volunteers in Development*. The Ministry of Overseas Development has compiled a handbook of *British Aid Statistics* (HMSO). The Report of the Commission on International Development *Partners in Development* (the Pearson Report 1969) reviews the problems of the less developed countries and makes recommendations for their solution by means of aid policies.

IV DEVELOPMENTS IN THE BRITISH ECONOMY SINCE 1960

1 INTERNATIONAL DEVELOPMENTS

The Balance of Payments

The balance of payments problem dominated events in the British economy in the 1960s. It is therefore important to analyse the balance of payments in some detail to understand the circumstances which led to the devaluation of the pound in 1967 and the transformation of the balance of payments after 1968.

Developments may be followed in the table showing the balance of payments in the new form of presentation introduced in 1970. In the old presentation (see G7) a distinction was made between the *basic balance* (current plus long term capital account) and short term *monetary movements*. But it became increasingly difficult to make this distinction because of the growing variety and intricacy of capital movements. Instead a line was drawn between the *total current flow* (current account plus all capital flows) and *official financing*. If the total currency flow is negative this means that the authorities have to finance the deficit either by borrowing from the IMF or other monetary authorities or by drawing on the official reserves of gold and foreign exchange.

Developments up to 1964

(1) The Current Account

The deterioration in the current balance of payments of well over £400 million between 1959 and 1960 was mainly attributable to an increase of nearly £500 million in imports. Exports also increased but not by enough to pay for the increased imports. The main cause was the upsurge in demand in 1959–60. During the upsurge productive capacity at home became strained, and some goods were imported to supplement home supplies. Stocks of imported goods were run down in 1959 and replenished in 1960. And higher incomes meant higher demands for im-

ported goods. These developments might be interpreted as indicating the adverse effects on the balance of payments of internal expansion. No doubt imports will increase as the economy expands, but it can be argued that sudden and very rapid bursts of expansion as in 1959–60 will have a much greater effect on imports than would a steadier and more sustained growth.

In the following two years imports were steady at about the 1960 level, the internal economy was relatively stagnant partly because restrictive measures had been adopted to curb demand at home and protect the balance of payments. Imports were sharply up by over £250 million in 1963 with the rapid expansion of national expenditure, but there was a slightly larger increase in the value of exports.

The surplus on invisible trade which had exceeded £300 million in the early and middle fifties ranged between £100 and £200 million in the early sixties (see G7).

(ii) The Capital Account

Capital flows may be divided into official long term capital flows, net private investment and various monetary movements *e.g.* trade credit changes in the sterling balances (see G8) and Euro dollar transactions (see G38). There was a fairly steady official long term capital outflow in the 1960s and a less steady net private investment abroad.

Most volatile were the monetary movements. For instance there would have been a large deficit in the currency flow in 1960 had it not been for a substantial inflow of short term funds (*e.g.* additions to our short term liabilities). The sterling balances rose by an unprecedented amount of over £400 million. This was largely due to speculation against the dollar based on fears that it might be devalued. So great was the inflow

* A plus sign denotes a rise in liabilities or a fall in assets and a minus sign a fall in liabilities or a rise in assets

that there was a curious combination of a very large deficit on current account and a substantial rise in our reserves of gold and convertible currencies

The dangers inherent in the financing of deficits through additions to short-term liabilities were vividly demonstrated the following year. Much of the funds which moved in during 1960 was moved out again before July 1961 in a wave of speculation against sterling. The outflow was financed partly by running down reserves of gold and convertible currencies by £280 million between end 1960 and July 1961 and partly through the Basle agreement under which European central banks undertook to build up short-term holdings in centres (London in this case) from which funds were being withdrawn. The rapid drain on the reserves had to be stopped and the European central banks were not prepared to see their sterling holdings rise much higher. So in July 1961 a series of crisis measures—including the raising of Bank Rate to 7 per cent—were taken primarily to protect sterling. In addition arrangements were made to withdraw over £500 million from the IMF with provision for further credits if necessary. In 1962 speculative movements of funds were much less violent. Aided by a substantial improvement in the current balance of payments Britain was able to complete repayments of its IMF drawing. These repayments did however involve a drain on the reserves and this explains the substantial fall in the reserves over the year.

The 1964 Crisis

Imports in 1964 were some £540 million higher than in 1963 whereas exports were up by less than £200 million. The remarkable increase in the value of imports cannot be explained simply as a rise in import prices: imports increased by 15 per cent in value and by 11 per cent in volume. Nor can it be seen merely as a response to the expansion of the economy. If imports had done no more than rise in line with output they would have increased in volume only by about 4 per cent. Part of the explanation lies in the fact that importers were stockbuilding after the depletion of raw material stocks during the boom of 1963. More important, however, is the fact that imports of manufactured goods rose by 28 per cent or

two thirds of the total rise in import value. This leads us to the conclusion that home producers were losing ground in the British market to foreign competitors. In the same way the disappointing performance of exports was due not to lack of overseas demand—world trade in manufactures rose by about 15 per cent in 1964—but to the diminishing competitiveness of British products.

(i) Remedial Measures.

The timing of Government action on the balance of payments position was influenced by the General Election of mid October. The out-going Government had been concerned with the impending Election and argued that the deficit was abnormal and could be expected to improve with out remedial action. On taking office the new Government decided that immediate remedial action was necessary. Three courses were possible. It could devalue the pound and so improve the competitive position of British exports and import-substitutes (see G6). But a devaluation was seen to have disadvantages. The price of necessary imports would be increased and this would lower the British standard of living; the ensuing wage demands would make it more difficult to implement an Incomes Policy—which is an alternative method of improving the British competitive position in world markets (see G38). Furthermore the devaluation of the pound might have necessitated the devaluation of other currencies including the dollar: this would have defeated the purpose of the devaluation. These real arguments against devaluation are not to be confused with the spurious argument that devaluation is somehow morally wrong. A second possible course of action was to reduce imports to a satisfactory level by the deflation of the economy. However national income would have to fall by a multiple of the required cut in imports. Deflation was rejected because it would cause unemployment and because it was considered to provide only a short term solution to Britain's economic problems: somehow the foreign imbalance had to be corrected without impeding the growth of output and productivity. A third course of action was to impose import controls or tariffs and export subsidies. Import controls were rejected for one reason: it would take time to set up the necessary administrative machinery

So it was that the Government decided upon an additional import tariff and an export subsidy.

Within two weeks of coming to power the Government announced its measures (which had in fact been investigated by the previous Chancellor). There was to be an immediate but temporary surcharge of 15 per cent on all imports of manufactures and semi-manufactures, the more necessary imports such as foodstuffs and basic raw materials were excluded. A new system of export rebates was introduced, representing the indirect taxes paid in Britain by British exporters, mainly duties on oil, petrol and vehicle licences. The value of the rebate averaged 1½ per cent of the value of exports. The import surcharge was critically received by the other EFTA members, it clashed with their objective of eliminating all tariffs by the end of 1966.

Some commentators have argued that Britain should direct its policies towards removing restraints on trade by cutting tariffs within EFTA or GATT or even unilaterally, lowering tariff barriers will contribute to efficiency by subjecting British industries to stiffer competition. By contrast it is also possible to argue that we should at times impose greater restraints on imports so that economic growth can occur without being hampered by balance of payments difficulties. The Government defended its action to the GATT Council in terms of an article in the Treaty which allows parties in balance of payments difficulties to resort to tariff restriction (see G8). Regrettably the GATT Council declared the import surcharge a violation of the Treaty.

(ii) Speculation Against Sterling

The large deficit in non-monetary capital flows in 1964 of £350 million was as remarkable as the deficit on current account. The outflow was due to an increase in private investment abroad, there was no increase in net Government lending. Part of the net private capital outflow in the first half of the year may have been abnormal and part in the second half of 1964 may have been related to the growing current account deficit. Portfolio investment in this country was not an attractive proposition and foreign firms tended to repatriate any funds available.

There was a net monetary capital inflow in the first half of 1964 which financed the growing overall deficit. The crisis arose in the second half of the year when an outflow of short-term capital—a flight of hot money—took place in expectation that a British devaluation would be necessary to cure the worsening imbalance. To protect the reserves the IMF granted Britain a stand-by of credit of £330 million. However once the feeling developed that the pound would have to be devalued the process became cumulative, the greater the outflow the more likely it seemed that Britain would be forced to devalue. A great deal of sterling was offered for sale by speculators holding pounds—the Gnomes of Zurich—and by British and foreign importers and exporters. In order to prevent the price of sterling from falling below the official minimum limit to the exchange rate of £1 = 2/8 (i.e. to support sterling) the Bank of England was itself forced to buy pounds. To do this the Bank had to draw on the country's reserves of gold and foreign exchange. The vast drain on the reserves could not be allowed to continue and in late November Bank Rate was raised by 2 per cent to 7 per cent. The aim of this measure was to lure back short-term capital funds with the high rate of interest and also to convince speculators that the pound would not be devalued. Speculators were not convinced however and the crisis continued. Two days later it was announced that an enormous loan totalling £1,070 million would be made available to Britain from all the leading Western central banks. This news was sufficient to slow down the speculative outflow and by the close of 1964 the selling had come to an end.

Events Leading to Devaluation

Imports increased a good deal more slowly than output in 1965, rising by only 1 per cent. This was partly because the stockbuilding of 1964 had come to an end and partly because the import

surcharge held back imports of manufactured consumer goods. The value of exports was 7 per cent higher in 1965 than in 1964 and their volume 5 per cent higher. Thus the current deficit was more than halved from the record of £400 million in 1964 to just over £100 million in 1965. The deficit on capital account was also cut considerably. Nevertheless an overall deficit in total currency flow amounting to £350 million in 1965 had to be financed by monetary movements.

The trade balance showed little improvement by mid-1965 and in the third quarter fear of devaluation led to yet another run on sterling, probably as severe as that of November 1964. The Government was again forced to draw on the IMF and to borrow from the United States Federal Reserve Bank. This time however the extent of speculation against the pound was successfully contained. When the trade balance improved rapidly in the second half of 1965 the speculation died away.

However this process did not continue into 1966 and confidence in the pound was further upset by the seamen's strike in May and June. Yet another flight of short-term capital occurred and this led the Government in panic to introduce a policy of deflation in a package deal known as the July measures (see G41). Only two measures improved the balance of payments directly: a reduction of the personal travel allowance outside the sterling area to £50 per annum and a proposed cut in Government overseas spending. The fall in demand resulting from the deflationary policy together with a wage freeze introduced at the same time (see G39) improved the trade balance and actually turned it into a surplus at the end of 1966. But it should be remembered that this improvement was achieved only at the cost of some unemployment of men and machinery and a slower rate of economic growth.

Imports rose in value by over 3 per cent and exports fell in value by nearly 2 per cent between 1966 and 1967. Thus the trade gap which had almost closed in 1966 widened to a record level in 1967. The rise in imports cannot be explained simply by the rise in demand as incomes rose by only 1 per cent between the two years, the July measures were taking effect. One reason for the surge in imports was the removal of the temporary import surcharge in the preceding November which caused a postponement of purchases until 1967 and reduced the price of imported goods competing with British products. Other reasons were the building up of imported stocks which had been depleted and the Middle East war in June which raised the price of essential oil imports. The main reason for the fall in exports was the exceptionally slow growth of world production in 1967, demand in the countries importing British goods was fairly stagnant. Exports were also hit by the dock strikes in September. The deficit in total currency flow over the year was £670 million of which perhaps £200–400 million was due to speculation. With the trade returns deteriorating sterling came under almost unremitting speculative pressure from the end of May onwards reaching a climax in November.

Devaluation of the Pound 1967

The Government recognised that action would have to be taken to improve the balance of payments and to obtain further foreign loans to protect the depleted reserves. The same alternatives were open as in 1964: deflation, import controls, tariffs and devaluation (see G29). Simple deflation to reduce imports was ruled out politically as the economy was now already in recession. Import controls and tariffs would meet with resistance from Britain's competitors and the GATT and tariffs had been tried in 1964 without success. The Government decided to devalue the pound.

The case for devaluation is a mixed one (see G8 and 29). It makes imports more expensive relative to home-produced goods and so demand for manufactured goods shifts away from imports but in the case of food and raw materials Britain must continue to import these essentials at the higher price because there are no domestic substitutes. It is possible therefore that devaluation will actually raise the import bill. However export receipts should be increased by a greater

amount. Britain exports its products in a highly competitive market so that the reduced price of British goods in terms of foreign currencies should lead to a considerable increase in the amount of exports.

This improvement in the trade balance depends on Britain being able to retain at least part of the price advantage gained by devaluation. However, since devaluation raises the price of imported goods it raises the cost of living, both directly and indirectly. *e.g.* imported raw materials rise in price, increasing production costs which are passed on as higher prices. The trade unions react to this cut in the standard of living by demanding wage increases. In this way a spiralling inflation can occur which entirely neutralises the gain from devaluation. Devaluation makes an incomes policy both more difficult and more important (see G37).

On November 18, 1967, the pound was devalued by 14.3 per cent from \$2.8 to \$2.4 to the £. Devaluation was anticipated by speculators and on the day before there was a run on the pound said to be greater than any previously experienced. The devaluation was unfortunately delayed by the need to achieve international co-operation so as to prevent a flurry of competitive devaluations. As it was only a few minor currencies—including those of Denmark, Hong Kong, Ireland, Jamaica, New Zealand and Spain—were devalued with sterling. It was also agreed among central bankers that Britain should be given credits of up to \$3,000 million including \$1,400 million standing credit from the IMF (see G38). This credit protected the reserves against speculation but it would have to be paid back out of balance or payments surpluses over the next few years.

Devaluation increases the demand for domestically produced goods and services. Imports are replaced by local substitutes and foreign demand for British goods increases. This switch in demand requires also a switch in scarce resources—labour and capital—into the exporting and import substituting industries if the new demand is to be met. To release resources for these industries it is necessary to reduce the demand for resources elsewhere in the economy. Accordingly the devaluation was accompanied by a series of deflationary measures (see G41).

Improvement after Devaluation

In his Letter of Intent to the IMF immediately after devaluation the Chancellor stated the Government's aim to improve the balance of payments by at least \$500 million a year. However, progress after devaluation was disappointing and fell far short of official expectations. The current account showed a deficit for 1968 of £319 million, no improvement on the deficit for 1967 of £312 million. Moreover, this improvement came on the invisible and long term capital accounts. The trade gap actually widened considerably. The value of exports rose by 20 per cent between 1967 and 1968, 8 per cent in price and 12 per cent in volume. But less than half of the increase in volume was due to devaluation, since world trade was growing rapidly. Despite the devaluation the volume of imports rose by no less than 7 per cent, outstripping the growth of output and largely because of devaluation import prices rose by 11 per cent so that imports increased in value by 18 per cent.

The balance of payments was transformed in 1969, improving strongly throughout the year. One reason for the improvement was a statistical correction. The discovery that exports had been systematically under-recorded for some years and that this had reached a level of over £100 million by 1969. But this does not mean that our much discussed balance of payments difficulties could be dismissed as a statistical illusion. The volume of exports grew by no less than 8 per cent between 1968 and 1969, mainly owing to the rapid increase in world trade. However, the British share of world exports fell by an unusually small amount. Imports rose in volume by only 2 per cent, being held back in part by the slackening of output growth and a decline in stock building. Another contributory factor may have been the import deposit scheme introduced by the Government in November 1968 by which importers were required to deposit with H.M. Customs for a period of six

months money equal to half (later 40 and then 30 per cent) of the value of certain imports. The improvement in the balance of payments enabled the Government at the start of 1970 to abolish the restrictions on expenditure by British residents on travel outside the Sterling Area and at the end of 1970 to abolish the import deposit scheme. Between 1969 and 1970 exports grew in volume by 5.5 per cent and in value by 12 per cent, but this was slower than the growth of world exports as a whole. British imports also grew rapidly, the increase in volume (7 per cent) being far greater than the increase in the real income of the economy (1.5 per cent). For only the seventh time since 1800 Britain's visible trade was actually in surplus in 1970.

The surplus on current account was no less than £440 million in 1969 and £631 million in 1970. But this improvement in current account after 1968 came more from invisibles than from trade. In 1969 the surplus on the invisible account was £580 million and in 1970 £623 million, the most improved components being private services, *e.g.* financial insurance and travel services, and net income from abroad. The total current account flow was transformed from an enormous deficit in 1968 (when the authorities borrowed £1,400 million) to a large surplus of £740 million in 1969 and one of £1,420 million in 1970.

Was the improvement in the balance of payments after 1968 an indication that the policy of devaluation had eventually succeeded? The efficacy of devaluation can only be judged after a few years and then with difficulty since we need to know what would have happened in the absence of devaluation. Economists have not produced a unanimous answer. It was still possible that in 1971 a reflation of the economy and the expected stock building (raising imports) the slower growth of world trade (curtailing exports) and an accelerated wage-price spiral of inflation (increasing competitiveness) would renew the balance of payments difficulties that had dogged the economy in the 1960s.

Britain's Debt Repayments

At the end of 1968 the British Government had short and medium term debts outstanding to central banks and the IMF of no less than £3,300 million. This represented about 10 per cent of the national income in 1968 and compared with gold and foreign exchange reserves of only £1,010 million. In 1969 however the surplus on the current account, the inflow of short term funds and a large positive balancing item reflecting unrecorded transactions (see the table on G29) enabled the Government to reduce its indebtedness by £700 million. The continued improvement in the balance of payments in 1970 and the first allocation of special Drawing Rights (see G38) enabled the Chancellor to announce in his April budget that the outstanding debts were down to £1,650 million while the reserves stood at £1,180 million. By December 1970 outstanding debts had fallen to £1,370 million and the reserves were £1,180 million.

Overseas Investment

At the end of 1967 the total stock of private long term investment by the United Kingdom overseas was estimated at £11,500 million and investment by overseas companies in the United Kingdom at £4,985 million. In that year the United Kingdom received income of £1,019 million from its overseas investments and paid out £800 million on foreign investments in the United Kingdom, the net income from interest, dividends and profits was £419 million. Investment abroad takes the form of portfolio investment (on foreign stocks or bonds) or direct investment (by British companies in their overseas affiliates). Well over half of this direct investment now takes the form of profits not remitted by affiliates.

The table indicates that United Kingdom investment abroad rose sharply in the second half of the 1960s despite the policy of requiring voluntary restraint on investment in the developed sterling area countries. However, foreign investment in the U.K. also rose rapidly, there was actually a net inflow of investment in 1969. At the same time interest, profits and dividends from British owned private capital overseas also

increased partly as a result of devaluation raising their sterling value net private income from abroad being no less than £800 million in 1970

Should the British Government encourage or discourage private investment abroad? In 1967 and 1968 Professor Reddaway published his Reports on this subject prepared for the Confederation of British Industry. He concluded that for every £100 of British direct private investment overseas British exports would immediately increase by about £11 i.e. there would be an initial drain on the balance of payments of £89. The average rate of profit on capital after overseas tax would thereafter be about £8 per annum or only £5 if capital appreciation was allowed for. In arriving at a policy for foreign investment the short term balance of payments loss must be weighed against the long term gain. The importance of the short term considerations depends on the state of the balance of payments e.g. if more investment overseas at a time of deficit causes the Government to take deflationary measures the national cost is great

duction has been hampered by the fixed price in the face of rising costs of gold production and also because an increasing proportion of newly mined gold has found its way into private speculative hoards and not into official stocks. The other main source of new international liquidity was an increase in dollar balances. By the late 1960s dollar balances actually exceeded the United States gold reserves

The second problem to have emerged is the weakness in the balance of payments of the reserve currency countries. Both Britain and the United States have had persistent deficits in recent years. As a result there have been periodic fears that the dollar or the pound would be devalued in terms of gold and other currencies. And this has resulted in speculation against the dollar and the pound (see G30). The inadequacy of international liquidity and the weakness of the reserve currencies produces a dangerous deflationary bias in the world economy (see G9)

(n) The Gold Crisis 1968

The United States has run a large and persistent payments deficit in the 1950s and 1960s. This was initially financed through the willingness of foreigners to run up dollar balances. However distrust of the dollar has grown and between 1960 and 1967 U.S. gold reserves were run down from \$19 500 million to \$12 100 million. After the devaluation of sterling in November 1967 the interest of speculators transferred from the pound to the dollar. Since many speculators expected the devaluation of the dollar in terms of gold to be followed by a corresponding devaluation of other currencies there was a growing demand for gold.

After 1961 the central banks of the major trading nations operated a *gold pool* in the London market whereby they agreed to exchange gold for currencies at existing official exchange rates. But with the growing speculation against the dollar the system could not be continued without endangering the U.S. gold reserves. The central bankers gathered for a crisis meeting in Washington on 17 March and decided to terminate the gold pool. They introduced two markets for gold with private transactions taking place in the free market at a price determined by supply and demand, and transactions among central banks taking place in the official market at the official gold price. The United States was now prepared to convert dollars into gold only for central banks i.e. to finance a deficit only on its current plus long term capital account. In this way speculation against the dollar could be controlled but the problem of the U.S. deficit on current and long term capital account was still to be solved.

The further monetary crisis of November 1968 produced by speculation against the franc and towards the mark, the possibility that the incoming Nixon Administration would raise the dollar price of gold and the limited sales on the free market by gold producers all helped to keep up the speculative demand for gold and its price in the free market. In the first year after the gold crisis the free market price averaged about \$40 compared with the official price of \$35 a fine ounce.

There was further currency speculation in 1969 in expectation of a realignment of European exchange rates. In August France, with a weak balance of payments devalued the franc by 11.1 per cent and in October West Germany with a

The International Monetary System

(i) International Liquidity

Imbalance in payments between countries is financed by transfers of gold or foreign exchange (see G8). These reserves of gold and foreign exchange are known as *international liquidity*. Their basic characteristic is general acceptability: they can perform their function only if they retain the confidence of those engaged in international transactions. Unless it is ultimately convertible into goods and services, gold has merely an industrial and ornamental value. But since most central banks are prepared to buy and sell gold at a fixed price in terms of their local currency confidence in gold is maintained.

Two *international reserve currencies* have emerged to supplement gold: the pound and the dollar. The pound has performed this function since World War I but the dollar has become the main reserve currency since World War II. Surplus countries are prepared to hold short term debt in pounds or dollars—so earning a rate of interest—confident that their future trading deficits can be financed by payment of these currencies or by their conversion into gold. These holdings are the *dollar and sterling balances* (see G7-8). Like gold they can perform their function as international reserves only if there is confidence that they can be converted into other currencies and hence into goods and services at current exchange rates. There is one other form of international liquidity—drawing rights on the IMF (see G8). At the end of 1970 gold accounted for 47 per cent of total international liquidity, foreign exchange reserves for 41 per cent, the IMF for 8 per cent and the newly created Special Drawing Rights (see G38) for 4 per cent.

In recent years two developments have undermined the present international monetary system. First, the growth of international trade has outstripped the growth of reserves with which to finance imbalances in this trade. Between 1952 and 1969 world trade measured in dollars rose by 220 per cent whereas international liquidity measured in dollars rose by only 35 per cent. Gold reserves have been a declining proportion of international liquidity partly because gold pro-

persistent surplus revalued the Deutschmark upwards by 9.9 per cent. Thereafter tension in the foreign exchange market was relaxed and hoarding and a fall in speculative demand for gold coincided with large sales by producers so that the free market price for gold fell to \$35 a fine ounce. The IMF reached an agreement with South Africa to buy South African gold in certain circumstances e.g. when the gold price is \$35 or below. This meant that newly mined gold could now enter official reserves and that the free market price would be unlikely to fall below the official price.

(iii) The United States Deficit

In 1970 the deficit in the United States balance of payments rose to a record level. This was financed by creditor countries increasing their dollar balances. They had little choice: a large scale conversion of dollar balances would force the United States to renounce its obligation to supply gold to central banks at \$35 per ounce. It became increasingly clear that if the United States failed to reduce its deficit by restricting capital outflows or military expenditures abroad the creditor countries would either have to go on financing American deficits by accumulating dollars or allow their currencies to appreciate in terms of the dollar. In 1971 the dollar appeared to be the weakest of the major currencies.

(iv) Reform of the International Monetary System

There is an increasing shortage of international liquidity which gives a deflationary twist to the world economy and threatens the continuation of free trade. What means are available to increase international liquidity? There are two main alternatives: a rise in the price of gold in terms of all currencies or the creation of an international paper money.

A rise in the gold price would increase international liquidity: first by increasing the money value of existing and future gold reserves and second by encouraging gold production. However there are certain disadvantages. It helps those countries most which need help least—those with large gold reserves. It represents a victory for the gold speculators and so acts as a stimulus to further hoarding and speculation in the future. It helps in particular the gold producing countries Russia and South Africa and finally it represents a sheer waste of economic resources: gold has little value except as a means of international payment. The most likely method of securing a general rise in the price of gold would be a devaluation of the dollar since most other currencies would be devalued simultaneously. Therefore devaluation could not cure the US deficit. For these reasons the United States Government decided against devaluation of the dollar at the time of the gold crisis.

The domestic currency of the United Kingdom is not backed by gold: on a one pound note the Governor of the Bank of England promises to pay the bearer on demand the sum of one pound—another pound note! Yet within Britain there is complete confidence in the currency because it is generally acceptable and so convertible into goods and services. Just as gold no longer backs the domestic currency there is no need for gold in settlement of international payments. All we need is a generally acceptable international currency: one in which all countries have confidence.

Such a currency could be created by an international authority constituted for this purpose and it could be made available to all countries which could then pay their creditors in the new currency. In this way the current shortage of international liquidity could be made good and indeed gold—Keynes' barbarous relic—could be supplanted. There are various difficulties in such a scheme. It would involve some loss of national autonomy and the vesting of considerable power in the international authority issuing the paper currency. Decisions would have to be made as to which countries should receive the new currency and in what quantities. And there is a fear that it would enable reckless governments to pursue inflationary policies without the discipline

imposed by shortage of reserves and that their inflation would be infectious. Many variations on this basic scheme have been devised in an attempt to surmount these—largely political—objections.

(v) Special Drawing Rights

In the past the IMF has merely provided deficit countries with loans to be repaid over a certain period (see G8). However the amount of these credit facilities has been increased over time. In 1969 the quotas paid to members to the IMF were raised by 50 per cent in 1964 by 25 per cent and in 1970 by about 35 per cent. Moreover in order to increase the resources available to neutralise the massive movements of short term funds which had so disrupted balance of payments in 1960 and 1961 the IMF initiated a scheme for a lenders club. In December 1961 the main trading countries—the Group of Ten—undertook (subject to some control by lending countries over the use of the funds) to make available loans totalling over \$2 000 million to the IMF for relending to countries of the Group suffering an outflow of short term funds.

In 1967 the members of the IMF agreed in principle to a scheme according to which Special Drawing Rights (SDRs) to member countries and in 1970 the scheme came into operation. SDRs are distributed annually to all members in proportion to their quotas with the IMF. They have a fixed value in terms of gold and like gold are generally accepted as a means of payment. Thus a deficit country can use its SDRs to buy the currency of the countries with which it has a deficit and the surplus countries in accumulating SDRs earn a rate of interest on them. This is a movement towards an international paper currency since the SDRs unlike IMF loans do not have to be repaid: they are a permanent addition to international reserves. The first allocation—totalling \$3 414 million of which Britain received \$410 million—was made in 1970 and further allocations were agreed for 1971 and 1972. The scheme was launched on a scale which is small in relation to the size of the problem but it is a step in the right direction.

(vi) Sterling as a Reserve Currency

The sterling balances (see G7 and G32) came under pressure from a new quarter in 1968. There were many sterling area holders of sterling balances including most governments who did not speculate against the pound in 1967 and suffered a capital loss when the pound was devalued. Anticipating further capital loss at the time of the gold crisis in 1968 they ran down their sterling balances so endangering the British gold reserves. In September the central banks of the major industrial countries agreed at Basle to grant the United Kingdom new credit facilities of up to £300 million for ten years with which to finance such sales of sterling. Also the British Government guaranteed the value in terms of US dollars of most of the official sterling reserves held by these countries in return for their holding at least a certain proportion of their reserves in sterling. These arrangements should help to protect sterling against the dangers of being a reserve currency.

(vii) The Eurodollar Market

The Eurodollar market is a market for bank deposits which are denominated in foreign currencies. It derives its name from the fact that most of the banks which accept these foreign currency deposits are in Europe (including Britain) and most of the deposits are denominated in US dollars. The Eurodollar market has grown at remarkable speed. A phenomenon of the 1960s the market involved deposits of \$9 billion in 1964 and \$37 billion in 1969. The reason for that growth was the profitability of Eurodollar transactions. Banks found that particularly if only large units of money were handled they could profitably borrow funds in country A and lend in country B while paying interest rates higher than those paid in country A and charging rates lower

than those charged in country B. Its growth was helped by the continuous deficit in the United States balance of payments since this meant that banks and institutions received dollars which they were willing to hold and lend. London is very important in the Eurodollar market. London banks accounted for no less than 57 per cent of the total external liabilities in U.S. dollars reported by European banks in 1963.

The European market—involving great mobility of short term funds—creates problems for the regulation of economic activity. The market affects the rates of interest and the availability of credit in different countries and money movements can thwart both restrictive and expansionist monetary policies (see G22).

Trading Arrangements

(i) First Application for Membership of the Common Market

In mid 1961 it was announced that Britain would apply for full membership of the *European Economic Community* otherwise known as the Common Market set up by the Treaty of Rome which was ratified in 1958. The European Economic Community (EEC) consists of six full members—Belgium, France, Holland, Italy, Luxembourg and Western Germany (see G9). Britain had participated in the negotiations which led up to its formation and had argued in favour of a looser free trade area without a common external tariff and excluding trade in agricultural products. No compromise acceptable to the Six was found and Britain joined with six other European countries—Austria, Denmark, Norway, Portugal, Sweden and Switzerland—in forming the *European Free Trade Area* (EFTA).

Later however when the Common Market proved to be highly successful in terms of the growth of production and trade the British Government decided to apply for membership. There were three main problems to be solved in the negotiations. The first two—the trading links with Commonwealth countries and the position of British agriculture—were those which had influenced the British attitude in the earlier negotiations. Now Britain also had obligations to her trading partners in EFTA. The Common Market countries welcomed the British application but made it clear that renewed negotiations must take place within the framework of the Treaty.

(ii) The British Proposals

The British delegation made the following proposals for the solution of Britain's special problems. For British agriculture there was to be a long transition period—that is to say a period for adjustment before British agriculture became fully integrated into the Common Market agricultural arrangements—possibly 12 to 15 years from the date of joining the Common Market. By contrast it was not proposed to negotiate for favourable conditions for British industry on joining the Common Market. Britain was prepared to make a reduction in her tariffs equivalent to the reductions which had already been made by the Six.

Two lines of approach were suggested for protecting the trading positions of the underdeveloped countries of the Commonwealth. One involved granting those countries the status of associated territories which would give their products access to European markets on preferential terms. There was a precedent for this sort of arrangement in that France had already negotiated associated status for some of her former colonies in Africa. But it was recognised that the Six might not be prepared to offer associated status to some of the larger underdeveloped countries of the Commonwealth—e.g. India and that some countries might wish to reject an offer of associated status for political reasons. As an alternative therefore it was suggested that the Common Market external tariff on some of the more important agricultural exports from these countries—e.g. Indian tea—should be reduced or eliminated and that arrangements should be made to ensure that the external tariff on manufactured goods exported from these countries—e.g. textiles from Hong

Kong—did not lead to a reduction of such export. For the more developed countries of the Common Market there were proposals that the Common Market external tariff on raw material imports should be reduced or eliminated for certain Commonwealth produced materials such as aluminium, zinc and wood pulp. It was also proposed that certain arrangements should be made with respect to foodstuffs—chiefly wheat, meat and dairy products—produced by developed members of the Commonwealth. The principle underlying these arrangements it was suggested should be that Commonwealth producers be given in the future the opportunity for outlets for their products comparable to those they now enjoy.

(iii) The Negotiations

In the course of prolonged negotiations considerable progress towards a final agreement was gradually made. Progress in reducing tariffs important in Commonwealth trade in agreement that Commonwealth countries in Africa and the West Indies should be offered associated status on the same terms as the ex-French territories and in agreeing that the problems of India, Pakistan and Ceylon could best be solved by trade treaties negotiated between the Common Market and these countries. The problem of temperate foodstuffs proved the most intractable. Britain wanted specific arrangements to ensure that Commonwealth produced temperate foods would be able to find markets in Europe at least in the short term. France made it clear that she envisaged a reduction of food imports into Common Market countries to permit an expansion of her agricultural output. This point of view was clearly incompatible with the British proposal for comparable outlets for Commonwealth producers. Nor was there agreement on the transitional arrangements for British agriculture.

Nevertheless it was the opinion of many observers that by January 1963 the stage had been set for a final round of bargaining and that given goodwill on both sides Britain's entry could have been assured. It therefore came as a surprise when France decided that the negotiations should be broken off. Despite opposition from the other five a French veto was imposed on the British application. Perhaps the fundamental reason for the breakdown can be inferred from a statement attributed to General de Gaulle. 'The Europe I prefer is the Europe of the Six.'

(iv) Britain's Second Application

In 1967 the British Government again began discussing with the EEC countries the possibility of British membership. This move had the support of most British industrialists. A Confederation of British Industry Survey in March showed that 90 per cent of replying companies believe EEC membership would be to their advantage. Confidential discussions went on but in December France vetoed the opening of negotiations on Britain's entry. With the resignation of General de Gaulle in 1969 the Common Market issue became live again and negotiations on the British application opened in 1970.

Although the negotiations were private some facts became known. For instance on the important issue of the British contribution to the Common Market budget (mainly for supporting EEC farmers) the British delegation proposed that this be in the region of 13–15 per cent of the total budget but the Community proposed 20–25 per cent.

(v) The 1970 White Paper

In February 1970 the British Government published a White Paper assessing the economic consequences of entry for the United Kingdom. The report recognised disadvantages as well as advantages. Britain would have to adopt the common agricultural policy and make a net contribution to the financing of that policy. Food prices would rise in Britain through the imposition of levies on imports from non-Community sources and the payment of Community prices for imports from other members. The maximum increase likely to

occur in retail food prices was estimated to be in the range 18-26 per cent spread over a period of years. The dismantling of tariffs on trade with the Community would reduce industrial prices.

The tariff cuts and the response of wages and prices to the increased cost of living would directly affect both industrial imports and exports. It being suggested that the balance of payments might be worsened by £125-275 million per annum on this account. But there would also be longer run dynamic and less predictable effects through the stimulus to British industry of being in a market of 300 million inhabitants and growing more rapidly than our own. The White Paper concluded that the balance of economic advantage was uncertain and that the precise conditions negotiated for entry would be important.

Those economists who oppose British entry argue that the successful growth of the EEC countries since its formation probably would have occurred without it: that Britain will have to pay heavily to subsidise backward European agriculture and they see a danger that Britain—having to compete from a peripheral location and restricted in its economic policies by EEC rules—will become a depressed region of the Common Market.

(vi) The Werner Plan

In 1970 the Commission of the European Economic Community published the Werner Plan, a report on the establishment of economic and monetary union of the EEC. The plan aimed at transferring within a decade the principal economic decisions from the national to the Community level and at establishing within the Community complete freedom of movement of goods, services, persons and capital with fixed and constant rates of exchange between national currencies or preferably a common currency. A centre of decision for economic policy would be established and made responsible to a European parliament. There was to be a common system of value-added taxation (see G42) and other taxes would be brought into line. The member countries have agreed to the initial stages of the Plan, e.g. to more co-operation in international currency arrangements.

These proposals have far reaching economic and political implications since they involve a considerable reduction of national sovereignty. For instance the loss of power to correct balance of payments deficits by means of trade controls or variation in the exchange rate implies either that the deficit country's currency should be generally acceptable to its creditors (so that the country within the Community—like a region within a country—simply cannot have a balance of payments problem) or the country must resort to deflation. And even if there is a common currency it is very likely that resources will concentrate in some regions of the Community to the neglect of other regions, possibly those far from the main centres of production and consumption. Complete mobility of resources is likely to produce a regional problem within the Community just as

it can produce regional problems within a country. But the Community may not to the same extent as a country possess the political power and determination required to remedy the problem.

2 INTERNAL DEVELOPMENTS

Industrial Output and Employment

In the fourth quarter of 1970 industrial production was 49 per cent higher than it had been in 1958. This expansion occurred largely in two spurts: during the twelve months between March 1959 and March 1960 industrial output increased by 11 per cent and between March 1963 and March 1964 it rose by 14 per cent. The three years before March 1960 the three years between the booms and the three years after March 1964 were periods of industrial stagnation. Industrial production picked up again in 1967 and 1968 but growth (11 per cent in two years) was not as rapid as in the boom periods and industrial employment actually fell. The table also indicates that numbers employed in industry were 4 per cent lower towards the end of 1970 (allowing for seasonal variation) than in 1958 so that productivity—output per person employed—rose by about 56 per cent over that period. Here again a very high proportion of the increase was secured in the boom periods.

Restriction and De restriction.

The 1960s have witnessed several changes in the emphasis of Government monetary and fiscal policies. In the first half of 1960 the emphasis was on restrictive policies, both because of the deterioration in the balance of payments position and because it was apparent that the very rapid expansion of output had created shortages and inflation in the economy at home. No doubt there would have been a slowing down in the rate of growth of output even if restrictive measures had not been taken. An increase as rapid as that in 1959 was possible only because a substantial excess capacity had developed over the preceding years. But the measures taken to restrict demand reinforced this tendency and growth in industrial output was halted.

A relaxation of restraints did help to stimulate some increase in output in the early months of 1961. But from July 1961—again primarily for balance of payments reasons—there was a phase of even sterner restrictions. The progressive relaxation of restrictions during the summer of 1962 coupled with measures designed to stimulate industrial output had not had any major effect by the end of the year.

In some ways the situation early in 1963 was analogous to that of early 1959. There was a substantial under utilisation of capacity in many branches of industry since some new investment had continued in 1960-62. Labour resources for expansion were available in that unemployment—at over 3 per cent—was higher than in any period since the war. Consequently the expansionist policies of 1963 helped to produce a year of

boom which saw a spurt of industrial output and a substantial increase in productivity. This progress could not be maintained in 1964 when industrial production and productivity flattened out and the balance of payments deteriorated. However the 1960 remedy of deflation was not immediately repeated: it was now realised that stop-go policies were harmful to the growth of the economy and that the balance of payments problem would have to be solved by other measures. Full employment was maintained between 1964 I and 1966 I but industrial production per man rose by only 1.5 per cent per annum. Two reasons have been suggested for this slow growth of productivity: a decline in the average working week (output per man hour increased more rapidly) and the tendency of employers to adjust their labour force to the level of production only with a considerable delay.

Balance of payments difficulties eventually led the Government to deflate the economy and there was a fall in industrial production in the second half of 1966 as the July measures took effect. Unemployment now began to lay off workers and unemployment rose from 1.2 per cent of the labour force in early 1966 to average 2.2 per cent in 1967. Despite the resumption of growth in 1967 and 1968 unemployment in the economy rose.

With industrial production stagnant in 1969 and 1970 and productivity continuing to rise the rate of unemployment increased to 2.5 per cent in 1970 and to over 700 000 (2.7 per cent seasonally adjusted) in early 1971. Industrial employment actually fell after the first quarter of 1969 and output per man rose as firms tried to shake out unneeded labour. The reasoning behind the government policy of prolonging the recession was no longer based on the balance of payments since this was strongly in surplus. Rather it was hoped that high unemployment would curb the rapid inflation.

Regional Planning

Much publicity has been given in the 1960s to the varying degrees of prosperity and levels of unemployment in the United Kingdom (see G18). Government measures are necessary to reduce disparities and probably even to prevent them from growing.

There are essentially two ways of tackling the problem of regional imbalances: taking jobs to the people or bringing people to the jobs. In so far as the latter alternative is chosen the Government should encourage the mobility of labour *e.g.* through retraining schemes or a housing subsidy. However the migration of population may damage community life in the deprived areas and cause congestion, housing shortages and overcrowding in the booming regions. The Government can create employment opportunities in the relatively depressed regions in various ways. It can try to induce expanding industries to set up new plants in these regions by offering tax incentives: it can authorise additional expenditure on public works—*e.g.* by accelerating road building programmes—to provide additional employment; it can place orders for the goods it needs—*e.g.* defence contracts—where work is required.

On taking office in October 1964 the Labour Government made regional planning the responsibility of its Department of Economic Affairs. Britain was divided into eight regions with the intention of producing a plan for each region. The Government also established two kinds of planning body: regional economic planning Councils and Boards to advise on and co-ordinate the planning of each region.

Recent Government policy to cure regional unemployment has taken the following forms. Various measures to defer public construction programmes have excluded the Development Areas. Fiscal incentives to locate industry in the depressed regions have been given *e.g.*, the cash grants provided in 1966 for new plants and machinery in manufacturing were at twice the national rate in the Development Areas. By contrast office building in the main conurbations London and Birmingham was strictly limited. To encourage the mobility of labour the Government introduced redundancy compensation and

achieved some expansion in both public and private training facilities. In 1967 regional differentials in the selective employment tax were introduced (see G41). Under this scheme manufacturers in Development Areas were paid 30s per week for each full time adult male employee and lower amounts in respect of other workers so giving the Development Areas a wage cost advantage in manufacturing of 5–10 per cent.

In 1964/5 special assistance to industry in the Development Areas was only £31 million. The estimate for the financial year 1968/9 was £265 million, taking the form mainly of the Regional Employment Premium and Investment grants.

In 1970 the incentive to invest in the Development Areas was affected by the Government's replacement of cash grants by a system of initial allowances against tax. Whereas cash grants were 40 per cent of investment in plant and machinery in Development Areas and 20 per cent in other areas there was now to be free depreciation in Development Areas and 60 per cent initial allowances in other areas. The relative attractiveness of the Development Areas would be reduced by the halving of SBT in 1971 and its abolition in 1972.

Planning for Faster Growth

There has been an increasing dissatisfaction with the rate of growth achieved in this economy over the past decade or so. The economies of most Common Market countries have increased their industrial output at a much faster rate. Furthermore there has been dissatisfaction with the way in which the economy has grown: the characteristic pattern has been one of sharp bursts of expansion interrupted by rather lengthy periods of stagnation.

(i) The National Economic Development Council

To stimulate a more systematic study of the problems involved in securing a faster and more even rate of growth in the British economy the Conservative Government established the *National Economic Development Council* (NEDC or NEDdy). The two tier organisation was similar to that of the corresponding planning council in France. The Council itself consisted of representatives from the TUC and employers organisations, Government ministers and independent members and it was served by a group of experts. This group undertook research into the problems of securing a faster rate of growth into the means of overcoming obstacles to growth and into the economic policies which could be most conducive to faster growth.

In its first report in 1963 the Council made a projection for the economy. It adopted a target rate of growth of output over the period 1961–66 equal to 4 per cent per annum which was substantially faster than the rate of growth actually achieved in previous years. It attempted to predict how investment, exports, imports, consumption and the output of each industry would have to grow if the target rate of growth was to be achieved. The merit of this exercise was two fold: it helped to focus Government attention on the long term by showing that policies designed to solve short term difficulties might intensify the problem of raising long term economic growth, and by bolstering expectations it encouraged firms to invest.

A particularly interesting feature of the work of the NEDC is its study of individual industries. Seventeen major industries were surveyed in detail to assess the changes in output, employment, productivity, investment and exports which were feasible in each industry. Economic Development Committees (EDCs)—which have come to be known as little Neddies—were established as part of the NEDC machinery to report on the problems of individual industries. It is impossible for an individual firm or industry to make correct decisions on future expansion without knowing how the rest of the economy will behave: by relating planning at the national level and planning at the level of individual industries the NEDC did valuable work.

(ii) The Department of Economic Affairs

In October 1964 the Labour Government established a new *Department of Economic Affairs* (DEA). While short term measures to regulate the economy or the balance of payments remained the responsibility of the Treasury the DEA took over from the Treasury the responsibility for long term economic policy. The DEA was charged with the task of preparing and implementing a realistic plan for economic expansion a prices and incomes policy and an industrial and regional policy. The NEDC now reconstituted became a consultative and advisory body a link between the Government and the economic community. However the EDCs continue to function and have produced a great many reports. The division between short and long term planning proved unsatisfactory and in 1969 the DEA was abolished and its functions reverted to the Treasury.

(iii) The National Plan

The National Plan for the British economy over the period 1964-70 was published by the Government in 1965. The Plan was based on the assumption that output would rise by 3.8 per cent per annum over the period. Since the labour force was expected to grow at 0.4 per cent per annum this meant an annual growth in productivity of 3.5 per cent—considerably higher than the 2.7 per cent average over the period 1960-64. The Plan specified the changes in investment consumption and public expenditure required to achieve this target.

In many ways the crucial assumptions were those concerned with the balance of payments. The Plan supposed that imports would increase by 4.0 per cent per annum and that to achieve a satisfactory surplus of £250 million on the overall balance of payments in 1970 exports would have to rise by 5.6 per cent per annum. If such a rapid expansion of exports were not achieved—and in the period 1960-64 the annual increase averaged only 3.1 per cent—the whole Plan could be jeopardised in that the balance of payments difficulties might as in the past appear to justify policies to restrict the growth in domestic output.

Indeed this is precisely what happened. The tardy improvement in the balance of payments led the Government eventually in July 1966 to deflate the economy. The ensuing stagnation meant that the Plan's targets for 1970 could no longer be achieved. However it should not be concluded that planning is necessarily an academic exercise. Planning has a valuable sight setting function: it can bolster firms' expectations and hence their investment and it can help to co-ordinate their decisions. Rather we should recognise that planning is worthless unless combined with Government policies which enable the planned targets to be reached.

(iv) "The Task Ahead"

In the uncertain economic climate after the July measures there was little point in long range planning. However early in 1969 the Government published as a Green Paper a new planning document *The Task Ahead: an Economic Assessment* to 1979.

It was neither a plan nor a forecast but part of the consultative planning process. Implementation was to take the form of consultation with the EDC or other representatives of each industry. The document was flexible in that new developments could be accommodated without requiring the whole assessment to be rewritten. There are three sets of projections—lower basic and higher—on the assumptions of a growth rate in real output of 3.3½ and 4 per cent per annum respectively. These projections compare with an actual growth rate of 3.3 per cent per annum between 1960 and 1966.

In fact the outcome again proved to be well below expectations. Between the first quarter of 1969 and the first quarter of 1971 real output rose by less than 2 per cent per annum. But this time the balance of payments could not be blamed for the shortfall. Instead it appeared that the stagnation was due to a loss of confidence by private investors and to the monetary and fiscal policies of successive Governments concerned about the acceleration of inflation.

The Industrial Reorganisation Corporation

The *Industrial Reorganisation Corporation* (IRC) was set up in December 1966 under Government auspices. Its functions were to promote industrial reorganisation in the interests of industrial efficiency e.g. by enabling industries to achieve economies of scale or by reorganising inefficiently managed firms. It assisted firms in agreed groupings and could intervene to encourage a particular takeover which in its estimation was in the public interest.

The IRC Act provided the Corporation with financial resources of up to £150 million. However its objective in making loans was to prod and not to prop inefficient firms. It supported mergers in electronics, trawling, nuclear power, mechanical engineering, and other industries. In 1970 the incoming Conservative Government decided to wind up the IRC.

Inflation

(i) Wages and Prices

Retail prices continued to edge upwards in the 1960s (see G17-19). In 1963 they were 35 per cent higher than in 1958. Very little of this increase can be attributed to an increase in import prices. To explain the inflation we must look at the behaviour of labour costs. Between 1958 and 1963 the nationally negotiated weekly wage rates rose by 48 per cent and weekly earnings—including overtime payments and payments negotiated on the factory floor—by 75 per cent. Since the increase in productivity during this period was slow income from employment per unit of output (indicating labour costs per unit of output) rose by 33 per cent. These increased costs were passed on to the public in the form of increased prices so that real earnings rose by only 28 per cent. The table shows annual average prices, earnings, real earnings and also real disposable incomes (i.e. the purchasing power of total personal incomes after income tax) all as indexes with 1963 = 100.

AVERAGE RETAIL PRICES WEEKLY EARNINGS REAL WEEKLY EARNINGS AND REAL DISPOSABLE INCOMES 1963 = 100

	Retail prices	Weekly earnings	Real weekly earnings	Real disposable incomes
1958	89.6	78.4	87.5	81.5
1963	100.0	100.0	100.0	100.0
1964	103.3	107.1	103.7	104.2
1965	108.2	115.1	106.4	108.4
1966	112.5	122.5	108.9	108.5
1967	115.3	126.2	109.5	110.0
1968	120.7	136.8	113.3	112.1
1969	127.2	147.5	115.9	112.5
1970	135.3	165.2	122.1	115.5

(n) The Growing Inflation

A disturbing feature of the table is the growth in the rate of inflation in Britain after 1967. Between 1968 and 1969 retail prices rose by 5.5 per cent between 1968 and 1970 by 6.5 per cent and between January 1970 and January 1971 by 8.5 per cent. The increase in average weekly earnings rose also.

Why has there been this acceleration in the rate of inflation? In 1968 and 1969 it resulted partly from the increase in import prices consequent upon the devaluation of the pound in November 1967 (see G30) partly from the increase in indirect taxes introduced after devaluation in order to free resources for exports (see G41) and partly from the spurt in money wages when the Governments incomes policy weakened (see G39). But in 1970 the blame could be placed squarely on the wage explosion. Normally money wages rise more rapidly the greater the pressure of demand in the labour market. But with unemployment high in 1970 pressure of demand for labour could not be the explanation. Rather the wage explosion appeared to reflect a general increase in militancy by trade unionists angered by the near stagnation of real earnings and real disposable incomes after 1967 and possibly influenced by events in other countries (see below). Once begun it was maintained by the growth of expectations that prices would continue to rise rapidly.

In 1970 there was a sharp increase in real earnings (by 5 per cent) implying a decline in the share of profits. This share (gross trading profits as a proportion of domestic income) is normally low during a recession but the share in 1970 dropped to 10 per cent compared with 14 per cent in the recession of 1962. The implication was that the wage increases of 1970 would have a delayed effect on prices in 1971 and this might set off further wage demands. There was a grave danger that a vicious spiral of inflation would be maintained or even accelerated in 1971.

(nn) International Inflation

The acceleration of inflation in Britain coincided with similar trends in other countries including the United States Japan W Germany France and Italy as the table shows

RISE IN CONSUMER PRICES

	1959-1969*	1968-1969	1969-1970**
United States	2.3	5.4	5.7
Japan	5.3	5.2	6.5
France	3.9	6.4	5.9
Germany	2.0	2.7	4.0
Italy	3.6	2.6	4.7
United Kingdom	3.5	5.5	6.8

* Annual average

** Third quarter to third quarter

Was this the result of a series of coincidences did the inflations have a common cause or were they contagious? Both France and Italy had major strikes and subsequent wage explosions. Britain's inflation too was cost-push not demand pull in character (see G4). Japan and W Germany experienced strong demand pressures and in the United States the price increases could be explained as a lagged reaction to the demand pressures of 1966-1969. Nevertheless it is likely that inflation was to some extent transmitted from one country to another—particularly from the United States and particularly to small trading countries—through its effects on the prices of imports and exports and possibly through its effects on workers expectations.

(iv) Effects of Inflation.

British Governments have been concerned about inflation mainly because of its effects on British competitiveness and hence on the balance of payments. If our costs rise relative to competitors costs British exporters find it more difficult to compete in foreign markets if they raise their

prices and if they keep prices down in order to compete this implies their having to accept lower profit margins on exports than on sales in the home market and so discourages exporting.

But inflation can have other harmful consequences. It often produces a redistribution of income with the strong gaining from the weak i.e. the poorly organised workers and the pensioners. In inflationary conditions income gains can appear to result not so much from work or sacrifice as from ingenuity and the exercise of economic and political power. Inflation can breed uncertainty and industrial unrest. In 1970 the number of strikes was up by 60 per cent on the annual average for 1960-1968 and the number of working days lost was up by 260 per cent. This was both cause and effect of the inflation.

Incomes Policy

Britain's competitive position in world trade has deteriorated relative to that of her main rivals the United States West Germany and France hence her balance of payments difficulties. The British share in total world exports of manufactures fell from 17.7 per cent to 11.9 per cent between 1959 and 1967. There are essentially two methods of remedying this situation. We must secure either a relative fall in the external value of the pound or a relative rise in its internal value. In other words either there must be a devaluation of the pound in terms of other currencies or we must have a policy to limit the increase in the British price level. Up to 1967 the Government concentrated on the latter alternative and attempts were made to introduce some form of incomes policy. In 1967 the Government opted for devaluation but incomes policy was still necessary if the devaluation was to be successful.

(i) The Pay Pause

In July 1961 the Chancellor of the Exchequer called for a pause in wages salaries and dividend payments. Exhortations for restraint have been a familiar feature of ministerial statements for many years but on this occasion the Government soon made it clear that it intended to use such power as it has to influence the amount and timing of wage and salary awards. It has power to decide when the pay awards recommended by the Wages Councils—which fix minimum wages for 84 million workers—shall be implemented. The Government's power is strongest over workers which it directly or indirectly employs e.g. civil servants teachers and Post Office workers. Their pay awards were cut back. The Government also had a limited influence on awards made in nationalised industries.

The pay pause came to an end in April 1962. It was envisaged as a temporary policy and its effects are difficult to assess. It certainly postponed some wage awards which would otherwise have been made in that period and it may have contributed to a stiffening of resistance to wage claims. But because the pause affected some groups of people more severely than others this form of incomes policy was seen to be discriminatory.

(ii) The National Incomes Commission

In February 1962 the Government issued a White Paper which outlined its incomes policy for the period after the pause. It stated that the objective must be to keep the rate of increase in incomes within the long term rate of growth of national production. In recent years national production has risen by about 2 to 2½ per cent a year. It is accordingly necessary that the increase of wages and salaries as of other incomes should be kept within this figure during the next phase. The Government stressed that most of the arguments which had in the past been advanced in justification of wage and salary claims—e.g. increases in the cost of living trends in productivity or profits in particular industries and comparisons with levels or trends in other employments—should be given less weight and that general economic considerations—i.e. the increases which the economy can afford given the

prospective rate of increase in national production—should be given more weight.

Late in 1962 the Government set up the *National Incomes Commission* (NIC). However the powers of this body were limited. It could not participate in nor comment upon wage claims while negotiations were in progress unless the parties involved consented and as the TUC did not intend to co-operate with the Commission such consent was unlikely. It could be asked to report on inflationary settlements which had been reached (unless the settlement was reached by arbitration) but it had no power to cancel or modify an agreement. NIC produced only 4 reports and was wound up after the change in Government.

(iii) The National Board for Prices and Incomes

In October 1964 the Labour Government's new Department of Economic Affairs was made responsible for achieving an incomes policy. The lessons of the past had been learned. The Government recognised that a successful incomes policy would require the support of both sides of industry. Its first objective was to achieve a Joint Statement of Intent on Productivity Prices and Incomes. This was signed in December 1964. In this document the TUC and the employers' organisations undertook to co-operate with the Government in producing an effective machinery for the implementing of an incomes policy.

It was Government policy that growth in earnings per employee should equal the planned growth in national output per employee of 3-4 per cent per annum. Thus in those industries (e.g. engineering) in which productivity growth exceeds this norm earnings should rise less rapidly than productivity and in those industries (e.g. railways) in which productivity growth falls short of the norm earnings could rise more rapidly than productivity. Moreover prices would be expected to fall in industries such as engineering and permitted to rise in industries such as railways. Growth in earnings per employee should exceed the norm only in exceptional cases (e.g. as a reward for increasing productivity by eliminating restrictive working practices if necessary to transfer labour from one industry to another if earnings are too low to maintain a reasonable standard of living or if a group of workers have fallen seriously out of line with earnings for similar work).

To make specific recommendations on the basis of this policy the Government set up a *National Board for Prices and Incomes*. It consists of an independent Chairman, a number of independent experts, a businessman and a trade unionist. The Prices Review Division of the Board can investigate the price of any goods in the economy and the Incomes Review Division has power to investigate all claims and settlements relating to wages, salaries and other incomes. In less than 5 years of operation the Board had produced over 150 reports on prices and earnings.

There was no statutory authority to enforce the recommendations of the Board; reliance was placed on voluntary methods and the power of persuasion and public opinion. However in late 1965 the Government introduced a compulsory Early Warning system whereby it is notified in advance of any intended increase in incomes or in certain prices. As a result the Government and the Board have time to consider increases before they are put into effect.

(iv) The Prices and Incomes Standstill

A voluntary incomes policy is very difficult to implement since it depends on co-operation among Government workers and employers moreover co-operation among representatives at the top may be undermined by wage drift at the factory level. Thus the annual average of weekly wage rates rose by no less than 6 per centage points between 1965 and 1966. In fact all of this increase took place in the period before July 1966. Clearly the voluntary incomes policy was meeting with little success.

Therefore as part of the July measures taken to deal with the balance of payments problem the Government introduced a prices and incomes

standstill. Increases in prices and incomes were as far as possible avoided altogether until the end of 1966. The only exceptions in the case of incomes were pay increases resulting directly from increases in output (e.g. piece work or over time earnings) and from genuine promotion or regular increments on a predetermined scale. Increases already negotiated but not yet implemented were deferred for 6 months. The first half of 1967 was a period of severe restraint. Any price increases were carefully examined and the norm for income increases was zero. Any increase in earnings had to be justified by one of the four conditions for exception referred to above. To enforce its freeze the Government took the unprecedented step of asking Parliament for reserve powers which were to be used only if the need should arise. These powers—including penalties for offenders—were contained in the new Part IV of the Prices and Incomes Act. For the most part there was a voluntary observance of the standstill, but from October 1966 the Government found it necessary to exercise its power of compulsion in a few cases (e.g. laundry and dry cleaning charges) and a wage agreement in the electrical engineering industry. The power of compulsion lapsed in August 1967.

The period of compulsion was followed by a year in which there was to be a 'nil norm' except where increases in incomes could be justified by one of the four criteria listed above. The Government could no longer legally enforce its policy but it did retain the power to delay price and pay increases through reference to the Board by up to 7 months. Whereas the Government succeeded in almost stabilising wages and prices during the year in which it took compulsory powers in the second half of 1967 weekly wage rates rose by 6 per cent. The advantage gained from the previous restraint was reduced but not entirely lost.

(v) Incomes Policy after Devaluation

Incomes policy was made both more difficult and more important by the devaluation of the pound. More difficult in that devaluation involved a cut in the standard of living and more important in that the trading benefit from devaluation should not be neutralised by inflation.

In April 1968 the Government published a White Paper outlining its policy for the period until the end of 1969. Wage increases must still be justified by the four criteria and there is a ceiling to increases in income of 3½ per cent per annum except for productivity agreements and low paid workers in certain cases. Price increases are permitted only as a result of unavoidable increases in cost per unit of output and price reductions are required when costs fall. Dividend increases are also subject to the ceiling of 3½ per cent per annum and home rent increases restricted. The Government intended to rely on the voluntary co-operation of unions and employers over pay but it decided to lengthen its delaying powers for pay and price increases up to 12 months and take powers to enforce price reductions recommended by the Board.

Between November 1967 and November 1968 the retail price index rose by 5.2 per cent mainly due to the effect of devaluation on import prices. In the face of this rise in the cost of living the incomes policy met with firm resistance. In practice the nominal ceiling of 3½ per cent per annum rapidly became the normal increase. In the first year after devaluation basic wage rates rose by 6.0 per cent and average earnings by 7.5 per cent. Workers were able to protect themselves against the inflation and to increase slightly their real incomes.

During 1969 the process of wage and price inflation accelerated. Between November 1968 and November 1969 average earnings rose by 8.0 per cent and retail prices by 5.4 per cent. In December the Government published a White Paper on its incomes policy for the period after 1969. It laid down a norm for wage increases of 2.5 to 4.5 per cent per annum. Increases should exceed the upper limit only in exceptional circumstances (e.g. in productivity agreements in cases where an inappropriate pay structure is rationalised or by means of job evaluation in the case of low paid workers and in the achievement of equal pay for

women. Comparisons with other workers should not be used except in the case of public servants (*e.g.* teachers and nurses) whose productivity can not be measured and whose pay tends to fall behind that of the private sector. The limit on the increase in company dividends of 3.5 per cent per annum was ended and the Government powers to delay the implementation of proposed wage and price increases were reduced. However the incomes policy laid down in the White Paper was tempered by the imminence of a General Election and the recent cost of living increases and it did not prevent a wage explosion occurring in 1970.

(vi) Conservative Policy

On taking office in June 1970 the Conservative Government eschewed its predecessor's approach to incomes policy and disbanded the National Board for Prices and Incomes. To curb the inflation it maintained the economy in recession and squeezed company liquidity, hoping in this way to weaken wage pressures and strengthen the resistances of employers. In addition it attempted to resist demands for wage increases in the public sector at the cost of prolonging strikes *e.g.* in electricity supply and postal services and it intervened to curb price rises in the nationalised industries *e.g.* postal charges and steel prices. These measures were by no means a sure remedy for the inflation spiral. The Government placed its faith on its Bill for the reform of industrial relations to solve the problem of wage inflation in the long run.

Monetary and Fiscal Policies since 1960

There is probably no country in the world which has made fuller use than Britain of budgetary policy as a means of stabilising the economy. Since 1941 almost all adjustments to the total level of taxation have been made with the object of reducing an excess in total demand or of repairing a deficit. Whereas in the United States there is still a public clamour for balanced budgets, British Governments have accepted Keynesian principles—first laid down by Lord Keynes—for managing the economy by adjusting the level of taxation and private saving relative to public expenditure and private investment. This does not mean to say that British policies have always been successful. Apart from the difficulty of deciding when demand is excessive or deficient there are the difficulties that data are available only with a serious time lag and may be inaccurate that economic events cannot be predicted with any certainty and that the quantitative effects of Government measures are not easy to estimate.

1960

In the first half of 1960 there were a series of restrictive measures designed to curb the increase in home demand and to improve the balance of payments position. Bank Rate was raised to 6 per cent. To exert pressure on the banks liquidity positions and so help to curb bank advances the banks were called upon to place special deposits (*see* G21) with the Bank of England. Restrictions on hire purchase transactions were also imposed. Furthermore the Budget was restrictive. The Chancellor estimated an overall deficit (*see* G24) for 1960-61 of only £320 million.

1961

The Budget was sternly anti-inflationary: profits tax and some indirect taxes were increased but there was a major reduction in surtax. In addition the Chancellor was granted powers to introduce if he considered it necessary an economic regulator—a surcharge on or rebate of indirect taxes by up to 10 per cent. This power provides greater scope for using fiscal measures to influence the economy in the periods between Budgets. In July 1961 the Chancellor introduced a collection of restrictive measures. These measures were primarily intended to ease the critical foreign exchange situation but they were not without effect on the domestic economy. Bank Rate was raised to 7 per cent. To restrict

the growth in demand the Chancellor imposed a 10 per cent surcharge in indirect taxation and called the banks to increase their special deposits at the Bank of England. Furthermore the Chancellor announced that he aimed to restrict the increase in government spending. Not only was the outflow of funds stopped but it was actually reversed. These measures were all too successful in restricting demand at home: there was a fall in industrial production in the second half of 1961.

1962

The 1962 Budget was however no less restrictive in intention than the 1961 Budget. The estimated overall deficit at £70 million was virtually unchanged. There was a move towards uniformity of purchase tax rates. The main novelty of the 1962 Budget was a tax on certain speculative gains. From the summer of 1962 on wards monetary and fiscal policies were designed to stimulate economic activity. Bank Rate was reduced to 4 per cent, all special deposits held by the Bank of England were released, qualitative restraints on bank lending were abolished, some post-war credits were released, investment allowances for industry were increased and the purchase tax on cars reduced.

1963

January 1963 saw further reduction in purchase taxes and a very considerable increase in social payments. The estimated overall Budget deficit for 1963-64 was more than £600 million greater than that of the previous year. Tax reliefs were announced: the most important benefits to individuals were derived from increases in the allowances which can be charged against income before income tax is levied in addition Schedule A taxes were abolished for owner occupiers. Other changes in taxation were designed to stimulate investment spending by companies: depreciation allowances were increased for tax purposes and companies investing in areas of high unemployment were permitted to charge depreciation on their assets at a rate of their own choosing. The Budget was designed to provide a fiscal boost to the economy and in this it succeeded: national output rose by more than 5 per cent over the year.

1964

By 1964 the economy was beginning to show signs of strain and the trade figures revealed a rapid deterioration in the balance of visible trade. The Chancellor's objective in his April budget was to slow down the rate of growth without producing deflation. He planned an overall deficit of £790 million but provided for additional taxation by increasing the duties on tobacco and alcoholic drinks by about 10 per cent.

Both consumption expenditure and industrial production jumped sharply towards the end of 1964 and there were reports of a growing labour shortage. The balance of payments was heavily in deficit throughout the year. Nothing was done about it however until after the General Election in October. In November the Chancellor of the Exchequer presented a little budget. An additional 6d in the £ was placed on the standard rate of income tax and there were increases in petrol duties in National Insurance contributions and payments. But old age pensions were increased. During the sterling crisis of November (*see* G30) Bank Rate was raised to 7 per cent to stem the outflow of funds but this was not accompanied by a credit squeeze to restrict productive investments as in the crisis of 1961. Unlike some of his predecessors the Chancellor had not opted for deflation as the cure for the balance of payments deficit. Instead reliance was placed on an import surcharge and an export rebate. However the British policy came under fire from some European Governments who called for a deflation of the British economy.

1965

The Budget contained two major fiscal innovations: a corporation tax and a capital gains tax. Full employment was maintained in 1965. The

April Budget was not deflationary the Government's overall deficit for 1965-66 was estimated at £720 million. In July because the balance of payments had shown no sign of rapid improvement the Chancellor found it necessary to introduce further measures: tighter controls on foreign exchange and on the terms of hire purchase and a postponement of public expenditure programmes. But this action was not sufficient to produce deflation and at the end of the year unemployment was still very low.

1966

The 1966 Budget was somewhat deflationary but its impact was delayed until September when the new *selective employment tax* (SET) came into force. All employers were required to pay this tax at the weekly rate of 25s for men 12s 6d for women and boys and 8s for girls. However manufacturing industries received a refund of 180 per cent the public sector 100 per cent while other industries—e.g. services and construction—receive no refund.

Up to mid 1966 the Labour Government's policy can be summarised as follows: to restrict the growth of demand somewhat but not as drastically as in the past to take direct action on the immediate balance of payments and to strengthen the long run balance by means of productivity policy and incomes policy. However in July during yet another run on sterling the Government embarked on a policy of deflation. In its July measures the Government used indirect taxation 10 per cent by means of its regulator placed a 10 per cent surcharge on surtax tightened building controls cut public investment for 1967/8 increased hire purchase restrictions and raised Bank Rate to 7 per cent. As a result of these measures the economy went into recession in the second half of 1966.

1967

Despite unemployment of 2.4 per cent and predictions of a further rise during the year the Chancellor produced a no change April Budget with an estimated surplus of £640 million. The balance of payments prevented him from taking deflationary measures. In mid year the Government gave some stimulus to consumers expenditure by relaxing hire purchase terms and increasing family allowances. But the balance of payments deteriorated and since further deflation was politically unacceptable, the Government devalued the pound. Devaluation was itself strongly deflationary—increasing demand for exports and for import substitute goods—and had to be accompanied by measures to release resources for these industries. Bank Rate was raised to the unprecedented height of 8 per cent bank advances were limited to all but priority borrowers e.g. exporters hire purchase on cars was tightened corporation tax was raised to 42½ per cent and the SET premium was to be withdrawn except for Development Areas.

There were also to be cuts in defence other public spending and nationalised industries' investment. Further cuts in government spending were announced in December and again in January when future defence spending was considerably reduced because of the decision to withdraw forces from East of Suez and the planned rise in the school leaving age from 15 to 16 was put off until 1972. Despite these several blows of the axe public expenditure was still likely to rise in 1968/9 by nearly 4 per cent in real terms but the rise in 1969/70 was estimated to be no more than 1 per cent.

1968

The April budget was highly deflationary. The Chancellor increased taxation to yield an additional £920 million per annum. Most of this came from indirect taxation, with purchase tax and taxes on spirits, wines, and tobacco all raised. Motorists were particularly hit by the increased vehicle and petrol taxes—perhaps not unfairly in view of the heavy social costs caused by road congestion. SET was to be raised 50 per cent, and betting duties were put up. Partly to gain support for the incomes policy the Chancellor raised family allowances and placed a heavy

special levy for one year on unearned income above £3 000 per annum. In deflating the economy the Chancellor was attempting to reduce private consumer demand so as to free resources for the export market and for replacing imports. Without such a transfer of resources the advantage gained from devaluation would be lost. His strategy was to produce an overall balance of payments surplus of the order of £500 million before resuming growth and in this way to break the vicious circle of stop go.

There was a stronger recovery of consumer demand and output and a weaker improvement in the balance of payments in 1968 than the Chancellor had expected and further restrictive measures were taken during the year. In May bank lending restrictions were tightened selectively and in November hire purchase terms were tightened and the regulator used to raise indirect taxes by 10 per cent.

1969

In February Bank Rate was raised to the record height of 8 per cent partly to help reduce bank lending and partly to retain short term funds in London owing to the shortage of international liquidity (see G31) central banks compete for short term capital by raising their discount rates.

The April Budget was somewhat restrictive: an additional £350 million per annum being raised in taxation. This was achieved mainly by increasing corporation tax to 45 per cent and SET to 48 shillings a week for adult males. In an attempt to encourage savings the Chancellor introduced a contractual savings scheme offering attractive tax free interest payments after a five or seven year period. Perhaps as a result of pressures from Britain's creditor the IMF the Chancellor emphasised the importance he would give to monetary policy (see G22). The Budget continued the strategy of improving the balance of payments at the expense of consumption.

In June the Chancellor published a Letter of Intent to the IMF stating his intention to limit the annual increase in real public expenditure to 1 per cent and the increase in domestic credit expansion to £400 million. Domestic credit expansion is defined as the increase in the money supply adjusted for changes resulting from external transactions. In fact domestic credit expansion turned out to be negative in the financial year 1969/70 credit was extremely tight except for the manufacturing sector. The growth of the economy in 1969 was slight, output being about 2 per cent up on 1968. Investment and consumption stagnated and the main impetus for expansion came from exports.

1970

Early in the year there was some slack in the economy which could be taken up by a policy of reflation. With the balance of payments improved and an election not far ahead the Chancellor therefore reduced taxation by £220 million. Even then because expenditure was to be restrained and income tax receipts rise with the inflation he expected a Government budget surplus of £820 million. It could not be claimed that this was an electioneering budget: output was planned to rise by 3.5 per cent in the next year. But the period of severe restraint on private consumption was over the expected increase being 3.9 per cent. Tax relief came largely in the form of increased personal allowances but these were so arranged that people with lower incomes benefited most. Those over 65 benefited from increased tax exemption and the minimum income for liability to surtax was raised because of the high cost of collecting surtax. Private investment was to be helped by the removal of quantitative controls on bank advances, and by increasing initial tax allowances on industrial building from 15 per cent to 30 per cent normally and 40 per cent in the Development Areas. The strength of the balance of payments enabled the Government to reduce Bank Rate from 8 per cent to 7½ per cent in March and again to 7 per cent in the Budget.

In October the new Government announced cuts in both public expenditure and taxation taking effect from April 1971. There was to be

a 6d cut in the standard rate of income tax and a cut in corporation tax. Also investment grants were to be replaced by a system of 60 per cent initial allowances. Prescription charges and dental charges were increased the subsidy on wel fire milk was ended the price of school meals was raised and the system of import levies on farm produce was extended. These changes involved a redistribution of income away from the poor. However a family income supplement (FIS) was introduced to provide a cash benefit for poor families with children.

Although real output grew by only 1.4 per cent in 1970 the Chancellor did not take any measures which would have an immediate deflationary effect. Monetary restrictions e.g. requirements of increased special deposits (see G21) were applied during the year.

1971

With business profits and liquidity down and business confidence weak private investment was low and the economy continued to stagnate. There was a need for a deflationary policy in 1971. The April Budget was somewhat deflationary with tax reductions of £550 million in the financial year 1971-72 and £680 million in a full year inclusive of the reductions previously announced. The Chancellor claimed as his objective an increase in output of about 3 per cent per annum. The main budget changes for 1971 were a further cut in corporation tax to 40 per cent a halving of SET an increase by £40 per child in the tax allowances for children a reduction in surtax particularly for very high income earners and a general increase in national insurance benefits and contributions. The Chancellor also announced his intention to make far reaching tax reforms in future years (see (v) below).

Tax Reforms

(i) Capital Gains Tax

The first move in this direction was the introduction of a tax on short term gains in 1962. But a more comprehensive innovation was the *capital gains tax* of 1965. This tax is levied on the gain realised on an asset between its purchase and sale provided this does not exceed the gain between 6 April 1965 and sale. It applies to all assets with limited exceptions the most important being owner occupied houses and goods and chattels realised for less than £1000. Gains realised by companies over any period are taxed at corporation tax rates. Gains by individuals on assets held for more than a year are taxed at a flat rate of 30 per cent. Gains realised within a period of one year were treated as ordinary income and taxed accordingly. However in his 1971 Budget the Chancellor made these gains also subject to the 30 per cent flat rate. He also exempted individuals capital gains where the assets sold during the year were valued at less than £500.

There are many administrative difficulties in implementing such a tax. Nevertheless it is an important attempt to remedy the inequality in the taxation of earned and unearned incomes.

(ii) Corporation Tax

In 1965 the Labour Government also introduced a *corporation tax* to replace the existing company income tax and profits tax. This tax at a rate of 40 per cent was imposed on distributed as well as undistributed profits so as to encourage the retention of profits for the financing of business expansion. The tax rate was subsequently raised to 42½ per cent and then to 45 per cent.

In 1970 the incoming Conservative Government reduced the rate of tax to 42½ per cent and in 1971 to 40 per cent. It was also announced that the Government intended to remove the discrimination in favour of retained income against distributed profits by decreasing the rate on distributed profits so that the burden of corporation tax and income tax together would be equal to the corporation tax alone on retained profits. This would have the effects of reducing profit retentions which would discourage investment and of easing share issue which would encourage investment.

(iii) Selective Employment Tax

The *selective employment tax* (SET) was introduced in the 1966 Budget (see G41) became partly an instrument of regional policy in 1967 and was raised in both the 1968 and 1969 Budgets. In 1970 the Labour Chancellor announced that it would become related to earnings rather than to numbers employed as from 1972. However the Conservative Chancellor announced that SET would be halved as from July 1971 and abolished in April 1972.

All employers are required to pay this tax at different weekly rates for men women and boys and girls but manufacturing firms and the public sector receive a refund. It is a selective tax on services and construction. The tax therefore discriminates against those industries which are labour intensive export little and whose output bears little indirect taxation. The SET is therefore a rough and ready means of forcing employers to release hoarded labour or subsidising exports and of evening up the incidence of indirect taxation.

In 1970 Professor Reddaway having been asked by the Treasury to investigate the effects of SET produced the first of his Reports. This covered the distributive trades which account for no less than 2.8 million workers. The Report used statistical analysis to show that the growth in productivity in the distributive trades after 1965 was well above the rate expected in the absence of SET and that profit margins and prices were lower than expected. The discrepancy could not be attributed entirely to SET however because other abnormal factors e.g. the progressive abolition of resale price maintenance (see G13) operated during that period. On the whole the Report was favourable to SET.

(iv) Value Added Tax

In his 1971 Budget the Chancellor of the Exchequer announced that SET and purchase tax would be replaced by a *value added tax* in April 1973. A value added tax was seen to have certain advantages: it could be applied evenly to almost all goods and services unlike purchase tax which was imposed on only a limited range of goods without infringing international rules exports could be exempted from the tax and so encouraged and it would be in line with practice in the Common Market countries. The Chancellor proposed to exempt food newspapers periodicals and books and also small traders. There might be a single rate or various rates of tax for different products.

The tax is levied as a certain percentage of *value added* at each stage of production (see G11). Here is a simple example on the assumption of a uniform 10 per cent rate. A producer imports raw materials valued at £100 and pays a tax of £10. He makes an intermediate product and sells it to a manufacturer for £200. The producer's value added is £100 so he pays another £10. The manufacturer makes a final product and sells it to a retailer for £500. His value added—accruing either as wages to his workers or as profits—is therefore £300 and he pays tax of £30. The retailer sells the product to domestic consumers for £700 his value added being £200 and his tax liability £20. The sum total of tax paid is £70 i.e. 10 per cent of the final product price but it is collected at each stage of production.

(v) Income Tax and Surtax

In the 1971 Budget the Conservative Government proposed to replace the existing income tax and surtax with a single graduated personal tax in 1973. It would have the following four principal features. The existing pattern of personal allowances would be retained there would be a basic rate covering a broad band of income and corresponding to the standard rate less earned income relief there would be higher rates above the basic rate applicable to the higher incomes and the distinction between earned and unearned income would be made by way of a surcharge on investment income above a certain level of such income. The purpose of the proposals was to simplify tax assessment and collection, to avoid misunderstanding as to the true marginal rates of tax, and to encourage saving.

GREEK MYTHS & LEGENDS

The ancient stories of Greece, woven into the fabric of our European culture by playwrights, artists and psychologists, are retold in the light of recent research. An index to the narratives ensures easy reference.

TABLE OF CONTENTS

Part I Introduction

GREEK MYTHS AND LEGENDS

PART I INTRODUCTION

(a) The Significance of the Myths and Legends

We all know how the stories and books that we knew in our youth have coloured our thought. So it is with the myths and legends of the earliest civilisation of Europe that of the Greeks. Their stories have entered the stream of consciousness of European men and women through the ages affecting their literature and art and even their ways of thinking.

The Origin of Myths True myth has been defined by Robert Graves as the reduction to narrative shorthand of ritual mime performed on public festivals and in many cases recorded pictorially. These rituals were says Graves archaic magic makings that promoted the fertility or stability of a sacred queenhood or kingdom—queenhoods having it seems preceded kingdoms throughout the Greek speaking area.

The immense diversity of these myths is partly due to geographical causes for in the widely differing districts of Greece different conceptions of the divinity and varying rituals of propitiation were evolved. There are also historical causes for the Mediterranean peoples worshipping an earth goddess were conquered by successive waves of Hellenes bringing with them some form of tribal sky god.

Legends Interwoven with the religious myths were a host of legends traditional stories which though not authentic had like the tales of Troy a substratum of fact. There were also all kinds of fables and anecdotes folk tales such as that of Perseus and allegories and romances which fused with the myths and legends to make a fascinating complex of stories.

Their Preservation in Literary Form These have been preserved for us largely by the Greek poets especially by Homer in his *Iliad* and *Odyssey* and by Hesiod in his *Theogony* works which probably date from about the eighth century B.C. The Greek dramatists of the fifth century B.C.—Aeschylus, Sophocles and Euripides—who relied on myth and legend for most of their plots also handed on the ancient tales though often in slightly altered form. Then about five centuries later Roman writers, such as Virgil, Ovid and Horace modelling themselves on the Greeks refashioned and embroidered their themes. It is not surprising that we have so many variants of the same tale.

This rich and complex treasure of Greek myth and legend has become increasingly familiar in Western Europe at first in Latin versions then after the Renaissance in the original Greek and today in excellent modern translations.

Their Significance Today Because of their extraordinary vitality and pervasiveness some familiarity with Greek myth and legend is almost indispensable to a full appreciation of our European culture.

In Art and Literature Great painters like Botticelli, Veronese and Rubens made the ancient stories the subject of their pictures and writers

from Shakespeare to James Joyce have enriched their work by constant reference. The French dramatists from Racine to Giraudoux are notable for relying on them for the basic plot of their dramas. Today when good and inexpensive translations enable us to go direct to Homer's *Iliad* or to see Euripides' *Medea* on the stage it is especially useful to have some general knowledge of the mythical background to the particular epic or play.

Psychology Not only to those who love art and literature is the knowledge of Greek mythology rewarding. Psychologists have found here suggestive symbols for the profound mental processes they are endeavouring to elucidate. Through Freud the term Oedipus complex is now a commonplace and Jung has found in the myths symbolic archetypes of human response.

Philosophy and Religion Philosophers also have found it profitable to return to the myths. Bertrand Russell emphasises the influence of Greek religion on Greek philosophy and through such philosophers as Pythagoras and Plato on Christianity itself.

Anthropology Of recent years anthropologists scrutinising the myths have been able to discern something of the way of life of primitive societies. The two volume Penguin *The Greek Myths* by Robert Graves incorporates some of their interpretations.

Archæology Perhaps the most exciting of all recent investigations are those of the archaeologists working on sites once considered only legendary. The German Schliemann trusting to the fidelity of his Homer actually unearthed the foundations of Priam's Troy and Agamemnon's Mycenæ finding fabulous treasure and proving to the astonished world that these antique tales were indeed rooted in fact. Through Schliemann's trust in Homer we have added an early chapter to History that of the Mycenaean culture of pre-classical Greece which flourished from about 1550 to 1200 B.C.

Another centre of ancient story the island of Crete was the field of Sir Arthur Evans' enquiries and his excavation of the magnificent Palace of Knossos not only pushed back the frontiers of history yet further to about 3000 B.C. but also showed how many Cretan legends had some factual basis.

More recent excavations at legendary Mycenaean sites on the mainland have led to the discovery of the Palace of Nestor at Pylos and the House of Cadmus at Thebes.

Tablets found at Mycenaean towns and in Knossos inscribed in an entirely unknown script Linear B have challenged scholars with a fascinating puzzle. After years of study Michael Ventris and others have at last been able to decipher the script. Although so far only seven tones are available it is significant that the language used is archaic Greek. We now know therefore that the Greeks of the Mycenaean age could write and that Homer's simple reference to writing is once more a faithful record.

of fact (See Book VI of the *Iliad* and the reference to Bellerophon's folded tablet.)

(b) The Historical Background to the Myths and Legends

Our knowledge of the earliest periods of Greek history is very recent. The great historian Grote writing in 1846 said that we must consider the First Olympiad of 776 B.C. as the starting point. Anything earlier was matter for conjecture. It is largely due to the discoveries of archaeologists that scholars are now able to push back the frontiers of history. From archaeological evidence they can now reconstruct the probable course of events from as early a date as 3000 B.C.

3000 B.C. Early Bronze Age It was about 3000 B.C. when the Neolithic Age was succeeded in the Eastern Mediterranean by the Early Bronze Age. That a bronze-using people akin to those of early Crete and the Cyclades entered Greece and fused with the Neolithic folk already there. These invaders were not Aryans but of Mediterranean stock and they worshipped the Great Goddess a fertility goddess who appeared in many guises. She was unmarried and in many instances her lover appeared to her in the form of a bird.

2000 B.C. Coming of Hellenes A thousand years later in the Middle Bronze Age a very different kind of people began to enter Greece. These were the Hellenes or Greeks, an Aryan people from the North for whom transport and conquest were easy by reason of their horses and wheeled vehicles. Unlike their predecessors they were patriarchal and their chief divinity was a tribal sky god but as they fused with the pre-Hellenic stock already in the country so their patriarchal worship mingled with the matriarchal and the sky god married the earth goddess.

Minyans and Ionians Successive waves of these Hellenes invaded the country in three main groups beginning in about 2000 B.C. with Minyans and Ionians.

Minoan Culture Penetrating far south to the islands and to Sicily Southern Italy and Asia Minor they became expert navigators. They were much influenced by a brilliant and sophisticated Minoan culture already flourishing in Crete and this began to have considerable effect on the mainland of Greece from about 1500 B.C. onwards.

1400 B.C. Achaeans In about 1400 B.C. however Crete fell destroyed either by earthquakes or by invaders. For the Achaeans the second wave of Hellenes had now begun to enter Greece and from about 1400 to 1100 B.C. Mycenae on the mainland was probably the centre of civilisation in the Aegean world.

Mycenaean Culture It is this Mycenaean culture of the Late Bronze Age which seen through legend is depicted in Homer's *Iliad* and *Odyssey*. Mycenae is Agamemnon's own citadel, and other cities where archaeological remains are now being found are named in the *Iliad*'s Catalogue of Ships. The Achaeans as Homer shows them were a conquering feudal aristocracy and a concerted attempt probably made by them in the beginning of the twelfth century B.C. to seize the Black Sea trade may be reflected in the epic of the siege of Troy.

1200 B.C. Dorians But the Achaeans themselves were soon to be defeated for at the end of the twelfth century B.C. the last influx of invading Hellenes the Dorians ancestors of the classical Greeks entered the country. They practically destroyed the Mycenaean civilisation and the Late Bronze Age now gave way to the Iron Age.

The Olympian Divinities The close fusion between the early non-Aryan Mediterranean

people with their matriarchal culture and the successive waves of patriarchal Hellenes was reflected in the Greek worship of Olympians. The ancient earth goddess of fertility lived on in such guises as Aphrodite or Hera and Zeus sky god of the Hellenes appropriately took Hera to wife. Indeed many deities such as Demeter or Athene combined in the single divinity both Mediterranean and Hellenic traits.

A third element in Greek Olympian religion derived from a Hittite culture flourishing in Asia Minor in about 1800 B.C. which had developed from a Hurrian culture of about 1500 B.C. Hesiod writing in about 750 B.C. incorporated some violent Hurrian myths of the cannibalism of the gods in his *Theogony* or *Birth of the Gods*.

The "Epic Cycle" By the eighth century B.C. there was in existence a rich store of myth and legend known as the Epic Cycle which was drawn on by Homer and also by later poets and dramatists.

Homer's Picture Homer whose epics were probably completed at the end of the eighth or in the seventh century B.C. presents the composite myth and legend of Greece in highly civilised form as the beliefs of a successful warlike aristocracy. The twelve deities dwelling on Olympus acknowledged the supremacy of Zeus and Dionysus the god of wine and ecstasy who entered from Thrace in the eighth century B.C. was still an outsider a god of the lower orders.

The Coming of Dionysus But by the fifth century B.C. Dionysus had been accepted as an Olympian taking the place of Hestia. The growing popularity of his worship which induced an ecstatic union with the god in a frenzy partly stimulated by wine partly mystical shows the need of the recently civilised Greeks for an impulsive religious expression which was not always satisfied by the prudent cults of the serene Olympians.

Orpheus From the worship of Dionysus developed that of Orpheus which aimed at mystic union with the god through enthusiasm wholly mystic and through purification. The Orphics believing in the transmigration of souls and an after life had much influence on the Greek philosopher Pythagoras and this influence was transmitted through Plato into Christianity itself.

The great influence of Greek religion on philosophy has only recently been recognised and Bertrand Russell commends especially the study of John Burnet's *Early Greek Philosophy* especially its second chapter Science and Religion.

(c) Bibliography

There is no one book or Bible of Greek myths. Many versions exist and in a short account it is not possible to record all variations. The reader is advised to consult the masterpieces of Greek literature now available in translation.

PART II NARRATIVE OUTLINES

THE OLYMPIAN CREATION MYTHS

1-22

1 Uranus and Ge The infinite and empty space which existed before creation was known as Chaos. The Earth or Ge sprang from Chaos and herself gave birth to Uranus the Heavens and Pontus the Sea. Ge then became by Uranus the mother of the hundred handed giants the Hecatoncheires or Centimani (Cottus Briareus also called Egeon and Gyres or Gyges) of the one eyed Cyclopes (Brontes Steropes and Arges) and of the twelve Titans. Greek writers give inconsistent lists of these Titans but those most frequently mentioned are Cronus Oceanus Hyperion and Iapetus and the Titanesses Rhea Themis Tethys and Mnemosyne.

2 Barbarous stories follow of Uranus dealings with his descendants and these have been influenced by myths from the Hittite culture which flourished in 1800 B.C. in Anatolia or Asia Minor and which probably embodied still earlier Babylonian material. These Hittite legends reached Greece through the Phoenicians and Hesiod (eighth century B.C.) a poet whose family had recently come from Asia Minor incorporated them in his *Theogony*.

3 Revolt of Cronus Uranus had thrown his rebellious sons the Cyclopes into Tartarus in the Underworld and Ge persuaded the Titans with the exception of Oceanus to rise against their father. She gave Cronus the youngest a flint sickle and with this he unmaned Uranus. Drops from the wound falling upon Mother Earth she bore the three Erinyes or Eumenides the furies Alecto Tisiphone and Megaera, and from drops that fell into the sea Aphrodite was born.

4 Uranus deposed the Titans freed the Cyclopes but Cronus now supreme consigned them again to Tartarus along with the Hundred-handed giants.

5 Cronus then married his sister Rhea and mindful of the curse of Uranus and Ge that he also would be deposed by his own son he swallowed each of his children at birth.

6 Birth of Zeus But when Zeus the youngest was born Rhea gave Cronus a stone to swallow and saved Zeus who according to Minocan tradition was brought up in the Dictaeon cave in Crete. In 1900 the reputed birth-cave was explored by archaeologists—probably the first men to enter for two thousand years—and there they found votive offerings to the god which may have been left there in the second millennium B.C. It was here that the Curetes Rhea's priests, clashed their weapons to drown the cries of infant Zeus while a goat Amalthea acted as his nurse and was rewarded by being placed among the stars as Capricorn while one of her horns became the Cornucopia or horn of plenty.

7 Zeus when of age was counselled by Metis the daughter of Oceanus and with Rhea's help gave to Cronus a potion which obliged him to

disgorge first the stone and then his other children Hestia Demeter Hera Hades and Poseidon. These now joined with Zeus in a contest against their father and the other Titans who were led by Atlas.

8 War between Zeus and Titans The war known as the Titanomachia was waged in Thessaly and lasted ten years until Ge promised Zeus victory if he would free the Cyclopes and the Hundred handed giants from Tartarus.

9 The Cyclopes gave to Zeus a thunderbolt to Hades a helmet of darkness and to Poseidon a trident. Thus aided the three brothers overcame Cronus and the Hundred handed giants stoned the other Titans who were defeated and consigned either to an island in the West or to Tartarus guarded by the Hundred handed Atlas was punished by being made to carry the sky on his shoulders but the Titanesses were spared. The supersession of the old dynasty of Titans by the new order of gods is the theme of Keats fine poem, *Hyperion*.

10 The Olympians Zeus and his brothers now divided the government by lot. To Hades fell the Underworld to Poseidon the sea and to Zeus the sky while the earth was common to all. Zeus the greatest of the gods lived on the lofty summit of Mt Olympus between Macedonia and Thessaly along with Poseidon and their sisters Hestia goddess of the hearth, Demeter goddess of agriculture and Hera who became the wife of Zeus. Seven other divinities Aphrodite Pallas Athena Apollo Artemis Hephaestus Ares and Hermes were also numbered among the twelve great Olympians, and at a later date a new comer Dionysus took the place of Hestia.

11 The Giants' Revolt But the troubles of Zeus were not over. A post Homeric story tells of the giants revolt. Twenty-four giants with serpentine tails sons of Ge tried to avenge the imprisonment of their brothers the Titans by attacking Olympus. Led by Alcioneus, they included Porphyreon Ephialtes Mimas Pallas Enceladus and Polybutes. Only after terrible struggles in Olympus and on earth were the giants defeated by the gods who were helped by a magic herb of invulnerability found by Heracles who always dealt the giants the final blow.

12. The story offered some explanation of huge bones found at Trapezus and volcanic fires at neighbouring Bathos and Cuma the reputed sites of the battles. The burial of Enceladus under Mt Etna in Sicily and of Polybutes under Nisyros likewise accounted for their volcanic nature. The inclusion of Heracles before his apotheosis indicates the late origin of the legend.

13 Ephialtes and Otus Another version of the giants revolt ascribes it to the gigantic Alceides Ephialtes and Otus sons of Iphimedeia by Poseidon but named after Alceus whom their mother later married. At the age of nine Ephialtes and Otus first captured and imprisoned Ares god of war and then vowing to outrage Hera and Artemis they piled Mount Pelion on

Ossa in the attack on Heaven. Artemis induced them to go to the island of Naxos in the hope of meeting her but disguised as a doe she leapt between them and they killed each other in error. Hermes then released Ares and the spirits of the Alcidae were tied with vipers back to back to a pillar in Tartarus.

14 **Typhon** After the destruction of the giants, he in revenge brought forth the gigantic monster Typhon, fathered on her by her own son Tartarus. His huge limbs ended in serpents' heads and his eyes breathed fire. When he approached Olympus the gods in terror fled to Egypt disguised as animals. Zeus as a ram, Apollo a crow, Dionysus a goat, Hera a white cow, Artemis a cat, Aphrodite a fish, Ares a boar and Hermes an ibis. Athena alone was undaunted and persuaded Zeus to attack Typhon. After a fearful struggle in which Zeus was temporarily incapacitated and only rescued by Hermes and Pan, he destroyed Typhon with his thunderbolts and buried him under Mt. Aetna, which still breathes fire.

15 The flight of the gods to Egypt serves to explain the Egyptian worship of them in animal form.

16 **Prometheus and Epimetheus** The creation of mankind is often ascribed to Prometheus, whose name signifies forethought, as that of his brother Epimetheus means afterthought. These two unlike their brother Atlas had supported Zeus during the war with the Titans. But Prometheus, the clever benefactor of mankind, by stealing fire from Olympus and giving it to humans brought upon himself divine vengeance.

17 The infuriated Zeus ordered Hephestus to make a lovely woman, Pandora, the Eve of Greek myth, who was endowed by the gods with baleful powers and taken by Hermes to Epimetheus. When he had married her she opened a box from which escaped all the which plague mankind.

18 Zeus punished Prometheus by chaining him to a crag in the Caucasus, where all day long an eagle tore at his liver which grew whole again during the night. Only after many generations did Heracles, with the consent of Zeus, shoot the eagle and free the heroic rebel.

19 The agony of Prometheus is the theme of Aeschylus' tragedy *Prometheus Bound*, the liberator is depicted in his lost drama *Prometheus Unbound*. Shelley's dramatic poem of the same name takes Prometheus as a symbol of those who challenge tyranny for the sake of mankind.

20 **Deucalion and Pyrrha** Deucalion, the son of Prometheus, is the Noah of Greek myth. When Zeus decided to wipe out mankind by releasing a great flood on earth, Deucalion, warned by his father, made an ark which saved both himself and his wife Pyrrha, daughter of Epimetheus. After nine days the flood subsided and the ark came to rest on Mt. Parnassus.

21 Deucalion and Pyrrha then earnestly prayed at the shrine of Themis that the earth might be re-peopled. Themis appeared and commanded them to throw the bones of their mother behind them. They interpreted this as meaning the rocks of mother earth and those flung by Deucalion became men, those thrown by Pyrrha women.

22 Their son, Hellen, was the mythical ancestor of all the Hellenes.

THE OLYMPIAN DEITIES 23-128

ZEUS 23-28

23 Zeus identified with Jupiter by the Romans was the greatest of the Olympian divinities, omnipotent king of gods, father of men and possibly master even of fate. Legends of his origin and supremacy are told in para. 6-20.

24 Zeus was the bright god of the sky, whom the invading Achaeans introduced into Greece in about 1200 B.C. together with his consort, Dione. Her worship, however, did not penetrate south of Zeus' shrine at Dodona in Epirus, where the rustling of oak leaves was interpreted as the voice of the god, and Zeus found other wives. His Olympian consort was Hera, who was in origin the Great Goddess of the pre-Hellenic matriarchal society. This marriage symbolises the fusion of the Achaeans with their predecessors.

25 He first married Metis, daughter of Oceanus and Tethys, but when she was pregnant with Athena, he swallowed her and brought forth Athena from his head. His second wife was Themis, daughter of Uranus and Ge, a divinity representing order, and their children were the Hours and the Muses or Fates, though some say that the Fates were daughters of Erebus and Night, and that even Zeus was subject to them. To Zeus and Hera were born the deities Ares, Hebe and Hephaestus, unless the latter was the parthenogenetic son of Hera. Zeus was also the father of Persephone by his sister Demeter, of the Charities or Graces by Eurydice, and of the Muses by Mnemosyne.

26 By mortal women, four Olympian deities were children of Zeus: Hermes, the son of Maia; Apollo and Artemis, the children of Leto; and Dionysus, the son of Semele. Zeus loved many mortal women, and Hera was intensely jealous and revengeful towards them and their children.

27 Although Zeus' earliest oracle was at Dodona, he was said to dwell with his fellow divinities on the summit of Olympus in Thessaly, and was also worshipped at Olympia in Elis. The Greeks dated their era from the first festival of the Olympiad in 776 B.C.

28 Zeus alone used the thunderbolt and was called the thunderer. The oak, the eagle and mountain summits were sacred to him, and his sacrifices were usually bulls, cows and goats. His attributes were the sceptre, thunderbolt, eagle, and a figure of Victory held in his hand. The Dodonean Zeus sometimes wore a wreath of oak leaves, the Olympian Zeus one of olive.

HERA 29-35

29 Hera, identified by the Romans with Juno, was the Great Goddess of the pre-Hellenic matriarchal society, whom Zeus, supreme god of the Achaeans, appropriately took to wife.

30 She was said to be a daughter of Cronus and Rhea, and reluctantly married her brother Zeus, who in the form of a cuckoo sought her out at Cnossos in Crete, or perhaps in Argos, and their wedding night was spent on Samos. Ge gave Hera the tree with the golden apples later guarded by the Hesperides.

31 Though Hera was treated with reverence by the gods, she was greatly inferior in power to Zeus and must obey him, her subordination reflecting the attitude of the Achaeans towards women. Only in her power to bestow the gift of prophecy was Hera equal to her husband.

32 She was often rebellious and jealous of Zeus' intrigues and persecuted his children by mortal women. At one time, with Poseidon and Apollo, she led a conspiracy of all the Olympians save Hestia to put Zeus in chains. He was freed by Theseus and Briareus and punished Hera by hanging her with wrists chained to the sky and an anvil on each ankle.

33 Hera bore Zeus Ares and Hebe and annually renewed her virginity by bathing in a spring near Argos. As properly speaking the only married goddess among the Olympians, she was worshipped

as goddess of marriage and the birth of children the Lithyia being her daughter.

34 Hera was of majestic stature and her attributes were a diadem, veil, sceptre and peacock. Samos and Argos were seats of her worship.

35 Because of the judgment of Paris she was relentlessly hostile to the Trojans.

HESTIA, 36-37

36 Hestia called Vesta by the Romans and the eldest sister of Zeus was a divinity brought to Greece by the invading Achæans. Though Poseidon and Apollo both sought her love she swore by Zeus always to remain a virgin.

37 She was goddess of the fire on the hearth supremely important in those days because so difficult to rekindle and was naturally thought of as goddess of home life. Each town or city had its sacred hearth which like that of the home was an asylum for suppliants. The first part of all sacrifices offered to the gods was due to Hestia, the most pious and kindly of all the Olympians but at a later date Dionysus took her place among the twelve Olympian gods.

ATHENE 38-45

38 Athene whom the Romans identified with Minerva was the embodiment of wisdom and power.

39 The Achæans brought with them a young warrior goddess who bore the titles Kore Parthenos Pallas meaning girl, virgin, maiden and she was in about 1700 B.C. identified with an older pre-Hellenic Palace Goddess worshipped in Crete. The Palace Goddess was one aspect of the Great Goddess revered not for motherhood but for feminine intuition and from pre-Hellenic times comes the name Athene.

40 The complex Pallas Athene was thus not only the patroness of women's arts such as weaving, protectress of agriculture, inventor of plough, rake and ox yoke but also a warrior, a wise tactician appearing in armour and wearing on her breast or shield the head of Medusa during the Trojan War, the great protagonist of the Greeks. Legends of the birth of Pallas Athene reveal how the patriarchal Hellenes took over and made their own a matriarchal divinity.

41 She was said to be a daughter of Zeus and Metis but before her birth an oracle had foretold that she would be a girl and that if Metis had another child it would be a son who would depose his father. Zeus therefore swallowed Metis and later suffered an agonising headache as he walked by Lake Triton. Hermes realising the cause persuaded Hephestus or according to some Prometheus to cleave open Zeus' skull from which Athene sprang completely armed.

42 The centre of her cult was Attica and Athens and legend said that when Athene and Poseidon contended for the possession of the city the gods judged it should belong to Athene who in planting the olive tree had conferred the better gift.

43 Preferring to settle quarrels peaceably Athene established here the court of the Areo pagus, where if votes were equal she herself gave a casting vote to free the accused as in the trial of Orestes.

44 In 566 B.C. Pausanias founded the great Panathenæic festival celebrated every fourth year and its magnificent procession was represented on the frieze of the Parthenon now in the British Museum while the birth of Athene was represented in the gable at the east end of the Parthenon and the contest with Poseidon at the west. Pausanias also introduced a new coinage with the head of Athene on one side and the owl her bird upon the other.

45 Other pre-Hellenic acropolises were sacred to Athene and her worship flourished in Sparta, Corinth, Argos and Thebes.

HEPHESTUS 46-56

46 Hephestus identified with Vulcan by the Romans was the smith god, a superb artist in metals.

47 He probably originated as a pre-Hellenic fire god near the Mt. Olympus of Lycia in Asia Minor where tenuous vapour seeping through the soil ignited. The Lyrians emigrated to Lemnos where they became known as Pelasgians and again found fire issuing from the earth and this fire became the symbol of their god Hephestus.

48 The cult of Hephestus spread to Athens where his artistic genius was so venerated that in the frieze of the Parthenon where two pairs of gods are given positions of honour Zeus appears with Hera and Hephestus with Athene.

49 In Homer's time Hephestus was one of the twelve Olympians, his exalted position reflecting the importance of the smith in a Bronze Age society when weapons and tools had magical properties. He is like other smith gods represented as lame, possibly because the tribe deliberately lamed their smith to prevent his running away, possibly because work at the forge developed muscular arms but feeble legs.

50 According to Homer Hephestus was the son of Zeus and Hera, though later tradition says that he was son of the goddess alone, just as his fire sprang mysteriously from the earth.

51 Born lame and weak Hephestus was so much disliked by Hera that she threw him from Olympus when he fell into the sea and was cared for by the sea goddesses Thetis and Eurynome in a grotto under the sea.

52 After nine years Hera took him back to Olympus where he had a fire smithy but on one occasion he enraged Zeus by taking Hera's part so that he was again hung from Olympus this time by Zeus. He was a day falling and alighted in the evening on the island of Lemnos as described in *Paradise Lost* Book I lines 740-746. Later writers diverge from Homer in making this second fall the cause of Hephestus' lameness.

53 He again returned to Olympus and acted as mediator between Zeus and Hera though the gods laughed at him as he hobbled about.

54 His workshop on Olympus was in his own palace and all the palaces of the gods were made by him. He also made the magnificent armour of Achilles, as is described in the eighteenth book of the *Iliad*, the necklace of Harmonia and the bulls of *Æetes*. Later accounts place his workshop on the volcanic island of Sicily where the Cyclopes served him.

55 In the *Iliad* Hephestus' wife was Charis but in the *Odyssey* she was Aphrodite who was unfaithful to him with Ares. How Hephestus caught the two together in an invisible net he had made and exposed them to the ridicule of the gods is told in a poem known as the *Lay of Demodocus* incorporated in the eighth book of the *Odyssey*.

56 Hephestus' favourite spots on earth were Lemnos and volcanic islands like Lipara, Hiera, Imbros, and Sicily. In Greek art he is represented as a vigorous man with a beard, carrying a hammer or similar instrument and wearing an oval cap or chiton.

APHRODITE, 57-63

57 Aphrodite goddess of desire identified by the Romans with Venus was derived from the Great Goddess of pre-Hellenic times, her counter-

parts being the orgiastic Ishtar of Babylon and Astarte of Syria

58 She was worshipped as a fertility goddess at Paphos in Cyprus whence Phoenicians took her worship to Cythera, an island off Southern Peloponnese. Probably as late as the eighth century B.C. her fertility cult was established on Acrocorinth above Corinth. There was a similar sanctuary on Mt Eryx in Western Sicily. In these places the goddess was served by young girls but in other Greek states her worship was more that of protectress of the city.

59 According to Hesiod Aphrodite sprang from the seed of Uranus and rose naked from the sea as in Botticelli's picture. The Birth of Venus. Rising near the island of Cythera she passed to Paphos in Cyprus.

60 Homer makes Aphrodite the daughter of Zeus and Dione and represents her as wife to Hephaestus. She was however unfaithful to him and in love with Ares. The amusing situation when they were caught together is described in para. 55. Harmonia was one of their children.

61 Aphrodite also bore sons to Poseidon and Priapus to Dionysus and later stories tell that she bore Hermaphroditus to Hermes and Eros to either Hermes Ares or Zeus.

62 Her love for the mortal Adonis is the theme of Shakespeare's *Venus and Adonis* and one of the Homeric hymns tells of her passion for Anchises' cousin, Priam to whom she bore Aeneas the hero of Virgil's *Epic*. Unfortunately Anchises' boasting of Aphrodite's love was struck by Zeus with a thunderbolt.

63 Aphrodite possessed a magic girdle which made the wearer irresistibly lovely and desirable. Doves and sparrows were sacred to her. Her most beautiful statue was that of Praxiteles in the fourth century B.C. a copy of which is preserved in the Vatican. The Venus de Milo may be seen in the Louvre.

ARES 64-67

64 Ares god of war who was identified by the Romans with Mars was a divinity of Thracian origin whose worship spread through Macedonia to Thebes Athens and cities of the Peloponnese especially Sparta. Ares was however not popular with the Greeks who disliked purposeless war and despised the Thracians for enjoying it and their attitude is reflected in the myths of Ares.

65 He was the son of Zeus and Hera and as he delighted in battle for its own sake he was hated by the other gods except Eris Hades and Aphrodite who was in love with Ares and he with her. The two were once trapped together in a net which Hephaestus had engineered as is described in para. 55.

66 Ares was not always successful in battle. The Alceidae conquered him and left him imprisoned in a brazen vessel for thirteen months until he was released by Hermes. Athens twice vanquished him and Heracles also defeated him and forced him to return to Olympus.

67 According to a late tradition Ares once defended himself before the gods in a trial where he was accused of murdering Halirrhothius son of Poseidon. Since he pleaded that he had saved his daughter Alcippe from being violated Ares was acquitted, and the place of the trial became known as the Areopagus.

APOLLO 68-80

68 Apollo's worship probably derived from two sources from the Dorians who in about 1100 B.C. entered Greece and reached as far south as Crete and from Ionians living in the islands and mainland of Asia Minor who became acquainted with a Hittite divinity worshipped in Lydia and hence called Lycus.

69 Apollo's Dorian shrine was at Delphi near the Castalian spring on Mt Parnassus where he was called the Pythian or Lycus or the Ambiguous. His Ionian shrine was at Delos where he was called Lycus and Phoebus or Shining and where he was more closely associated with his twin sister Artemis.

70 Legends said that Apollo and Artemis were the children of Zeus and Leto but before their birth jealous Hera caused Leto to wander from place to place till she gave birth to Aletus under a palm tree at Oitygia and to Apollo beside a palm in the isle of Delos.

71 This story is told in the Delian Homeric Hymn of 700 B.C. while the Delphic Hymn tells how Apollo soon after his birth sought out the she-dragon Python on Mt Parnassus and there killed her taking over the Oracle of Earth at Delphi where his priestess the Pythiessa became the mouthpiece of his oracles which were imparted in hexameter verse. Apollo was commanded by Zeus to visit the Vale of Tempe for purification and to preside over the Pythian games held in Python's honour.

72 Hera still implacable sent the giant Tityus to violate Leto as she came with Artemis to Delphi though some say that it was Artemis who was attacked but the giant was killed by the arrows of Apollo and Artemis.

73 Apollo was not always subservient to Zeus. He once with Hera, Poseidon and other Olympians bound Zeus with chains and was punished by being sent with Poseidon as bondman to King Laomedon where by playing the lyre and tending the flocks he helped Poseidon to build the walls of Troy. On another occasion furious that Zeus had slain his son Asclepius Apollo retaliated by killing the Cyclopes. Zeus now sent him to serve King Admetus of Phaeia in Thessaly and again he kept flocks. He also helped Admetus to win his bride Alcestis and even ensured that the king should be restored to life if one of his family would die in his stead.

74 Apollo loved many mortal women including Cyrene mother of Aristaeus Coronis mother of Asclepius the healer and Aris mother of Miletus. The nymph Dryope was also seduced by Apollo but when he pursued the nymph Daphne she cried for help and was turned into a laurel henceforth Apollo's tree and the nymph Marpessa preferred his rival Idas. Apollo loved Cassandra daughter of Priam and conferred on her the gift of prophecy but when she disappointed him decreed that she should never be believed. Hyacinthus a Spartan prince in origin an earth deity was beloved by Apollo and when he was killed by the god's jealous rival Zephyrus the hyacinth flower sprang from his blood.

75 Apollo had varied characteristics. He was destroyer as his arrows indicated and sudden deaths were ascribed to him. It was he who sent plagues among the Greeks besieging Troy. But he was also protector warding off evil as his fatherhood of Asclepius indicated. He protected flocks and cattle as his service to Laomedon and Admetus showed and later writers particularly stressed this aspect.

76 As god of prophecy Apollo could communicate the gift to gods and mortals and of all the centres of his worship Delphi was the most famous. The shrine had probably been established by pre-Hellenic people worshipping Mother Earth and had been seized by invading Hellenes who killed Python the oracular serpent took over the oracles in the name of their own Apollo and held funeral games in honour of Python to placate the original inhabitants. The shrine was supposed to contain the Omphalos or navel stone of earth and a chasm which occasionally gave out intoxicating vapours. Over this Apollo's priestess Pythia sat on a tripod and uttered his oracle after chewing intoxicating laurel leaf. She was regarded as the mystical bride of the god.

77 As god of song and music Apollo appears in the *Iliad* delighting immortals. He was said to have received the lyre from Hermes and its seven strings were connected with the seven Greek vowels. In music none surpassed Apollo not even Pan nor Marsyas the satyr who had found Athena's discarded flute which played by itself. Defeated in a contest Marsyas was flayed alive by the victorious god. Apollo as leader of the Muses was called Musagetes. He valued order and moderation in all things his favourite maxims being 'Nothing in Excess' and 'Know thyself'.

78 Apollo also delighted in the foundation of towns and his oracle was always consulted before a town was founded.

79 In later writers he was identified with the sun god the result of Egyptian influence for in Homer Helios, god of the sun is completely distinct from Apollo.

80 The worship of Apollo typical of all that is most radiant in the Greek mind, has no counter part in the religion of Rome. Not till the end of the third century B.C. did the Romans adopt his religion from the Greeks.

ARTEMIS 81-89

81 Artemis whose Roman counterpart was Diana had two chief aspects. One was as Mistress of Animals, a goddess of the chase worshipped in primitive matriarchal society and probably owing something to the Britomartis and Dictynna worshipped as huntresses in Crete. The other originating in Asia Minor was of the age old mother goddess and is most clearly seen in Artemis Ephesia who was worshipped as an organic goddess.

82 Legends of the birth of Artemis are told in the story of Apollo and as his sister she shared many of his characteristics. She carried bow and arrows, made for her by Hephestus and had power to send plague and sudden death as when she and Apollo killed the children of Niobe. She was also protectress of children and young animals and goddess of the chase.

83 Like Apollo Artemis was unmarried and later writers stressed that she was a maiden goddess and severely punished any lapses. She changed Actaeon to a stag to be torn to pieces by his own hounds only because he had seen her bathing and some traditions say that she killed Orion because of his unchastity. The nymph Callisto who had been seduced by Zeus was in the form of a bear hunted down by the hounds of Artemis.

84 When Apollo was identified with the Sun Artemis was identified with Selene the Moon.

85 The Arcadian Artemis early worshipped in Arcadia as a huntress among the nymphs was unconnected with Apollo.

86 Another aspect of the goddess was as the fierce Artemis of Taurus to whom all strangers were sacrificed. Iphigenia was once her priestess and she and Orestes took her image to Brauron in Attica whence the goddess was called Brauronia. This Brauronian Artemis was worshipped in Athens and also in Sparta where boys were scourged at her altar until they spunkled it with their blood.

87 Artemis as an organic goddess had her chief centre in Ephesus, with its immensely wealthy temple and it was this Artemis that St Paul encountered (See Acts of the Apostles Ch. XIX).

88 Though usually regarded as a rural divinity Artemis was supreme in three great cities in Ephesus in Marseilles to which Ionian Greeks from Asia Minor took her cult between 600 and 540 B.C. and in Syracuse where she was known as Artemis Arethusa.

89 The goddess was often portrayed as a huntress as in the so called Diana of Versailles now in the Louvre. As huntress her chlamys reached only to the knees and she carried a bow, quiver and arrows or a spear and was accompanied with stags or dogs. As Selene she wore a long robe and veil and a crescent moon on her forehead.

HERMES 90-98

90 Hermes whom the Romans called Mercurius was originally one of the gods of the pre Hellenic people the divinity dwelling in the cairn or herma set up by shepherds as landmarks in wild country and so developing as a protector against predatory animals and a guide to travellers. This Hermes was identified with a similar divinity worshipped in Minoan Crete a Master of Animals a son or lover of the Great Goddess and therefore a god of fertility.

91 Legends said that Hermes was the son of Zeus and Maia an embodiment of the (re)lief of a goddess and a daughter of a lion whence Hermes name Atlantides.

92 The Hymn to Hermes of 600 B.C. tells that he was born in a cavern on Mt. Cyllene in Arcadia (from which he was sometimes called Cyllenius) and that he grew with amazing rapidity. When only a few hours old he went to Pieria and stole some of the oxen of Apollo which he drove to Pyllos and then returning to Cyllene he invented the lyre by stringing a tortoise shell with cow gut. Apollo on discovering the thief accused him to Zeus who ordered Hermes to restore the oxen. But when Apollo heard the lyre he was delighted, took it in exchange for the oxen and became the friend of Hermes leading him back to Zeus.

93 Zeus gave to Hermes supreme power over animals and appointed him his herald. Hermes also acted as herald to Hades conducting no shades to the underworld (See Virgil's *Aeneid* Bk. IV ll. 242 sqq.). As herald he was regarded as god of eloquence whence St. Paul the chief speaker was mistaken for him in Lystra of Asia Minor (see Acts of the Apostles Ch. XIV). Heracles promote peace and therefore trade. Thus Hermes came to be looked on as god of peaceable commerce.

94 He was also god of prudence and cunning and even of theft and was said to have helped the Fates in composing the alphabet. Many inventions ascribed to Hermes such as weights and measures the musical scale astronomy olive culture and the arts of boxing and gymnastics were pre Hellenic and the stories of his childhood may indicate how the Hellenes took over these arts in the name of their god Apollo. As a god of fertility and luck, Hermes presided over games of dice.

95 He played a part in such incidents as the rescue of Dionysus the punishment of Ixion the selling of Heracles to Omphale the judgment of Paris and the leading of Priam to Achilles but his most famous exploit was perhaps the slaying of Argus the hundred eyed giant sent by Hera to watch Io.

96 Hermes had several sons including Ichion herald to the Argonauts Autolycus the thief his son by Chione and Daphnus.

97 His worship flourished in Arcadia where he was to be found with Pan and the muses. It spread to Athens and he became one of the best loved of the Olympians.

98 Hermes attributes were the Petasus a travelling hat in later time adorned with wings the Alipies or winged sandals and the Caduceus, or herald's staff whose white ribbons were later mistaken for serpents because he was herald to Hades. Sacred to Hermes were the tortoise the palm tree the number four and some kinds of fish and his sacrifices were incense, honey, calves, pigs, lambs, and kids.

POSEIDON, 90-109

99 Poseidon identified by the Romans with Neptune derived from a god worshipped by the earliest Aryan invaders of Greece the Minyans and Ionians who entered the country in about 2000 B.C. It was with the aid of horses and wheeled vehicles that they quickly overcame any resistance and then the god Poseidon was often thought of as the horse whose hooves thunder on the earth. He is constantly evoked in Homer as earth shaker while many legends show him in equine guise. It is possible that he was originally thought of as a sky god a thunderer and the mate of an earth goddess who later developed as Demeter.

100 But when in about 1450 B.C. another wave of invading Aryans the Achaeans entered Greece they also brought their sky god a thunderer called Zeus possibly in origin identical with Poseidon and the latter recognised as an older brother of Zeus came to be revered as a sea divinity for the Minyans were by now expert in navigation.

101 According to legend Poseidon was the eldest son of Cronus and Rhea and when after the deposition of Cronus he and his brothers Zeus and Hades cast lots for sovereignty the sea became Poseidon's share. He dwelt in an under water palace near Egea in Euboea which is described in the beginning of the 13th book of the *Iliad* and here he kept his horses with brazen hooves and golden manes and when they drew his chariot over the sea it became tranquil.

102 He was said to have created the horse when disputing with Athene for the possession of Athens and he taught men how to bridle horses. He was the protector of horse races and horse and chariot races were held in his honour on the Corinthian isthmus.

103 In the form of a horse he raped his sister Demeter when she was disguised as a mare. Their offspring were the horse Arion and the nymph Despina and some say Persephone also though according to another version Demeter was searching for Persephone her daughter by Zeus at the time of the rape.

104 Poseidon though equal to Zeus in dignity was less powerful and resented the pride of his younger brother. He once joined with Hera, Apollo and other Olympians to put Zeus in chains and he and Apollo were punished by being sent as bondsmen to Laomedon. Here Poseidon built the walls of Troy hence called Neptunia Pergama. When Laomedon refused the wages due Poseidon sent a sea monster which would have devoured the king's daughter Hesione if she had not been rescued by Hercules. In the Trojan War Poseidon naturally sided with the Greeks though he became hostile to Odysseus after he had blinded Polyphemus son of the god.

105 Poseidon desired earthly kingdoms his attempts to take control possibly being political myths. He disputed with Athene for the possession of Athens but she was awarded the city because her planting of the olive was judged the better gift. When these divinities however disputed the possession of Troezen Zeus judged they should share it equally. In his claim for Corinth Poseidon received only the isthmus where the quadrennial Isthmian games were held in his honour while the Aegaeus was awarded to Helios.

106 Poseidon first intended to marry Thetis but when it was prophesied that her son would be greater than his father he paid court to Amphitrite daughter of Nereus. Only after Delphinus had most eloquently pleaded his suit did Amphitrite accept Poseidon who in gratitude placed Delphinus among the stars as the Dolphin. Amphitrite's reluctance paralleled by Hera's shrinking from Zeus and Persephone's from Hades probably represents the resistance of an early matriarchal society to a patriarchal system.

107 Poseidon's son by Amphitrite was Triton but he had many more children by other divinities and mortals.

108 One of them Scylla was particularly hateful to Amphitrite who is said to have turned her into a monster with six barking heads and twelve feet. Poseidon also loved the nymph Tyro mother of his children Pelas and Nereus and Eëthra the mother of Theseus. His offspring by Medusa were Chrysaor and Pegasus.

109 Sacrifices to Poseidon were usually black and white bulls. His symbol of power was the trident possibly in origin a thunderbolt by means of which he could shake the earth or subdue the waves and which became in Hellenistic and Roman times a symbol of sea power as it is today. Poseidon's other attributes were the horse and the dolphin and he was usually represented as accompanied by Amphitrite Triton Nereids and dolphins.

DEMETER 110-116

110 Demeter counterpart of the Roman Ceres was probably in origin a divinity of the Minyans who entered Greece in about 2000 B.C. and who revered her as an earth goddess a mate to their sky god who later developed as Poseidon. Both these divinities could take the form of a horse. The worship of this earth goddess then merged with that of the Great Goddess of the pre-Hellenic matriarchal society and Demeter was worshipped as the corn goddess.

111 She was daughter to Cronus and Rhea and sister to Zeus by whom she became the mother of Persephone or Kore the maiden herself another aspect of the goddess. According to the Homeric Hymn of the seventh century B.C. Hades asked Zeus permission to marry Persephone and as he received no downright refusal was emboldened to carry off the maiden as she was gathering flowers. Demeter wandered the earth searching for her daughter until Helios told her what Hades had done. She then shunned Olympus and wandered still on earth which she forbade to bring forth fruit. Zeus finally told Demeter that her daughter might return provided she had eaten nothing in the Underworld and he sent Hermes to escort her back. Hades agreed to let Persephone go but gave her a pomegranate to eat and it was at last agreed that she should spend a third of the year with him in Hades as Queen of the Underworld and the rest of the year with Demeter who once more allowed the earth to bear its fruit.

112 Inconsistent accounts are given of the place of the rape. Demeter's priests said it was Eleusis about twelve miles from Athens; the Latin poets Enna in Sicily where according to Ovid Persephone was gathering poppies. Some say it was Ascalaphus who saw Persephone take food in the Underworld and that because he revealed this he was turned by Demeter into an owl.

113 It is said that during her wanderings Demeter punished those like Abas son of Cleus who were unkind to her but showered blessings on those like Cleus himself and his son Triptolemus who received her hospitably in Eleusis and whom she taught the art of agriculture.

114 The Eleusian Festival in honour of Demeter and Persephone was probably fully established in Athens by Pseustatus at the end of the sixth century B.C. probably about the time when the cult of Dionysus was instituted. There was an annual procession from Eleusis to Athens and those who spoke Greek could be initiated into the final rite of the mysteries. The Thesmophoria celebrating the foundation of laws was also held in the goddesses' honour in Athens and in other parts of Greece.

115 The myth originated in the most primitive rites of seed time and harvest at a time when only women practised the arts of agriculture. Persephone representing the vegetation which dies down during the winter had her counterpart in the primitive corn puppet which was buried in winter to be dug up again sprouting in spring and later writers saw the story as an expression of the death of the body and the immortality of the soul.

116 In art Demeter was represented with a garland of corn or a ribbon and holding a sceptre, corn ears or a poppy and sometimes a torch and basket. Pigs were sacred to her. There is in the British Museum a fine statue of Demeter of about 320 B.C. which was found at Cnidus in Asia Minor.

DIONYSUS 117-128

117 Dionysus, god of wine, also called Bacchus by both Greeks and Romans, was not in Homer's time one of the aristocratic Olympian deities but a god worshipped by humble folk whom wandering bands of ecstatic worshippers brought into Greece from Thrace in the eighth century B.C. The cult which spread through Macedonia and Thessaly to Boeotia, Delphi, Athens and beyond was characterised by a mystic frenzy when the worshippers, intoxicated with wine, believed themselves to be at one with Dionysus or Bacchus, sometimes called Bromus, the Boisterous. The men who followed him were known as Bacchoi, the women Bacchae or Bacchantes or Menads or in Athens and Delphi Thyiads.

118 The immense popularity of the Dionysian cult, especially with women, indicates that among the recently civilised Greeks there was a longing for a more instinctive and impulsive life, valuing enthusiasm rather than prudence, and during the sixth century certain wise statesmen introduced the new cult among the other state religions. Dionysiac festivals were established in Corinth, Sicily, Delphi and Athens. In Delphi the sepulchre of Bacchus was placed near the very tripod of Pythia and his temple, a theatre, was at the highest point of the sacred precinct. In Athens, Peisistratus founded the Dionysia and the Panathenaic Games at about the same time and a theatre was set up where the worshippers of Bacchus enacted the first primitive drama. In the fifth century, when the Parthenon was finished, the new god had been accepted among the twelve Olympians, taking the place of Hestia. This change incidentally secured a majority of gods over goddesses on Mt. Olympus and is perhaps evidence of a society becoming increasingly patriarchal.

119 Legends said that Dionysus was the son of Semele by Zeus, who visited his beloved disguised as a mortal. When Semele was six months with child, jealous Hera, disguised as an old woman, persuaded her to ask her mysterious lover to appear in his true form. Unwillingly Zeus consented, hapless Semele was consumed by fire and her unborn child sewn up in Zeus' thigh to be delivered three months later as Dionysus.

120 The child was first entrusted to Athamas and Ino of Boeotia and reared in the women's quarters, disguised as a girl, until Hera, undetected, punished Athamas with madness so that he killed his own son. Hermes then took Dionysus to Mt. Nysa, where the nymphs cared for him, feeding him with honey and where he first invented wine. Zeus later placed the images of the nymphs among the stars as Hyades.

121 When Dionysus had grown to manhood, Hera drove him mad and he wandered through the world with his old tutor Silenus and a wild rout of Satyrs and Menads. He went through Egypt, Syria and Asia to India, overcoming military opposition, teaching the culture of the vine, founding cities and laws. He returned to Europe through Phrygia and then invaded Thrace.

122 Here Lycurgus, King of the Edonians, opposed his worship but, maddened by Rhea, he killed and mutilated his own son and the Edonians caused him to be torn to death by horses.

123 Dionysus now proceeded to Boeotia, and in Thebes was resisted by King Pentheus. But Pentheus was also driven mad and torn to pieces by the Menads or Bacchae, among whom were his own mother Agave and her two sisters, for in their frenzy they believed him to be a wild beast. This is the legend used by Euripides in his play *The Bacchae*.

124. Dionysus also visited the islands of the Adriatic. At Iarna he hired a ship bound for Naxos, but the sailors were Tyrrhenian pirates and steered towards Asia, intending to sell Dionysus into slavery. The god, however, turned himself into a lion and the oars into serpents. Ivy grew round the ship and flutes were heard. The terrified pirates leaping overboard were transformed to dolphins. Arrived at Naxos, Dionysus found Ariadne deserted by Theseus and at once married her. A Renaissance conception of this incident can be seen in Titian's picture, *Bacchus and Ariadne*, in the National Gallery, or in Tintoretto's picture in the Doge's Palace in Venice.

125 At Argos people refused at first to accept Dionysus, but when the women had been maddened by him, they admitted he was a god.

126 His worship established throughout the world, Dionysus was received into Olympus as one of the twelve great divinities, taking the place of Hestia. He brought Semele there from the Underworld and she was henceforth known as Thyone.

127 Dionysus was worshipped as god of the vital and intoxicating powers of nature and also because of his close connection with tilage and early civilisation as a law-giver. He was also god of tragic art. In art he was represented as young, handsome and athletic but later as slightly effeminate. He was accompanied with a wild crowd of Satyrs and Menads, the latter frenzied with wine and mystic exaltation and carrying cymbals, swords, serpents or the Thyrsus, a wand wreathed with ivy and crowned with a fir cone. The worship of Dionysus appealed strongly to women and many would spend the whole night on the mountain in ecstatic dancing and tearing wild animals to pieces. Sacred to the god were the ivy, laurel and asphodel and the dolphin, serpent, tiger, lynx, panther and ass. His sacrifice was usually a goat or ass.

128 The myths of Dionysus are evidence that there was at first much opposition to the ritual use of wine and the frenzy it engendered. The earlier drink of the Greeks had been a kind of beer flavoured with ivy and mead, and mead was the drink of Homer's Olympians. Wine was not invented by the Greeks but probably first imported by them from Crete, whither vine culture had probably spread from Mt. Nysa in Libya. The use of wine spread from Thrace to Athens and other civilised cities. The story of Dionysus' wanderings in India represents the spread of vine culture there.

PERSEUS 129-144

129 The ancient folk tale of Perseus' grandson of Acrisius has been told by Kingsley in *The Heroes*.

130 Acrisius and Proetus, the twin sons of Abas, King of Argos, eventually agreed after much discussion to divide their inheritance. Proetus became ruler of Tiryns, whose massive walls he built by the aid of the Cyclopes, while Acrisius ruled uneasily in Argos, for an oracle had declared that he would be killed by a son born to his daughter Danaë.

131 To prevent this disaster, Acrisius had Danaë immured in a brazen dungeon or tower with doors of brass, but all in vain, for Zeus visited her in a shower of gold and she became the mother of Perseus.

132 Not daring to kill Danaë, Acrisius set mother and son adrift on the sea in a chest, which floated to the isle of Seriphos, one of the Cyclades. Here it was found by the sailor Dictys and he took Danaë and her son to the king Polydectes, who received them hospitably.

133 When Perseus was grown to manhood, however, Polydectes sought to marry Danaë and

seized a pretext to send Perseus off to fetch the head of the Gorgon Medusa

134 Medusa and her sister Gorgons Stheno and Euryale who were the daughters of Phorcys and Ceto and dwelt in Libya had once been beautiful. But Medusa lay with Poseidon in one of the temples of Athene and the enraged goddess turned her into a winged monster with brazen claws and serpent hair so hideous that she turned to stone all who looked upon her

135 Athene eager to help Perseus against her enemy gave him a polished shield whereby he might see Medusa only in reflection. Hermes provided him with a sickle and told him how to procure winged sandals a magic wallet in which to carry the decapitated head and Hades helmet of invisibility

136 On Hermes' advice Perseus visited the Gorgons sisters the Graeae three old women grey from birth who had only one eye and one tooth between them and these they passed from one to another. Perseus found them on Mt Atlas and by snatching the eye and tooth forced the Graeae to tell him where he could find the sandals wallet and helmet. They directed him to the Stygian nymphs who gave him what he needed

137 Flying westward to the land of the Hyperboreans Perseus found the Gorgons asleep. He successfully beheaded Medusa and was astonished to see springing fully grown from her body the winged horse Pegasus and the warrior Chrysaor both of whom had been begotten on her by Poseidon

138 Though pursued by Stheno and Euryale Perseus in Hades helmet escaped to the south. Some say that he petrified the Titan Atlas by showing him the Gorgon's head and then flew over Ethiopia

139 Here he saw chained naked to a rock on the sea coast the lovely Andromeda and at once fell in love with her. He learned the cause of her plight from her parents Cepheus King of Ethiopia and his wife Cassiopeia. The latter had rashly boasted that Andromeda was more beautiful than the Nereids and when they had complained of this to Poseidon the sea god had sent a monster to lay waste the country. Only by the sacrifice of Andromeda said the oracle of Ammon could the land be delivered

140 Perseus promptly offered to rescue the maiden provided she would become his wife but after he had slain the monster Cepheus and Cassiopeia were reluctant to keep their promise for they said Andromeda had already been contracted to another. Their protégé and his followers arriving at the wedding attempted to seize the bride but were easily circumvented by Perseus who showed them Medusa's head and turned them all to stone. Poseidon set the images of Cepheus and Cassiopeia among the stars the latter in a humiliating position

141 Perseus with Andromeda now hastened to Seriphos where he found that Danaë and Dictys had been obliged to take refuge in a temple but going to Polydectes' palace he exposed the Gorgon's head and turned the king and all his followers to stone. He then gave the head to Athene who set it in her aegis and Hermes restored Perseus accoutrements to the Stygian nymphs

142 After making Dictys King of Seriphos Perseus taking with him Danaë and Andromeda returned to Argos and Acrisius mindful of the oracle fled to Larissa in vain however for Perseus visiting Larissa and taking part in public games accidentally killed his grandfather by a throw of the discus

143 Grieved by this mishap Perseus arranged to exchange kingdoms with his cousin Megapenthes the son of Proetus who now moved to Argos while Perseus became King of Tiryns. He

also founded Mycenae which like Tiryns itself had mighty fortifications built by the Cyclopes

144 The massive remains of both cities have been investigated by Schliemann and other archaeologists and remain as some of the most interesting antiquities in all Greece

BELLEROPHON 145-150

145 The story of Bellerophon is told by William Morris in *The Earthly Paradise*

146 Bellerophon the son of Glaucus King of Corinth having killed one Bellerus fled to Proetus King of Tiryns. Unfortunately Proetus' wife Anteia fell in love with the young man and when he refused her advances falsely accused him to her husband of trying to seduce her. Proetus reluctant to kill a guest sent him instead to Anteia's father Iobates King of Lycia carrying a letter which requested that the bearer be put to death

147 Iobates also shrank from killing a guest and decided to send Bellerophon against the Chimæra a fire breathing monster with a lion's head goat's body and serpent's tail said to be the offspring of Echidne and Typhon which was now ravaging Lycia

148 Bellerophon was advised to catch the winged horse Pegasus sprung from Medusa Pegasus by striking his hoof on the earth of Mt Helicon had created the spring of Hippocrene sacred to the Muses and he was found by Bellerophon at another of his fountains that of Pirene in the Acropolis of Corinth. The hero flung over the horse's head a golden bridle which Athene had given him and astride his flying steed he easily shot the Chimæra with his arrows

149 The frustrated Iobates now sent Bellerophon against the Amazons and when the hero again returned victorious planted an ambush of guards against his arrival. Bellerophon slew them all and Iobates convinced at last that there had been some mistake produced Proetus' letter and learned the truth. He gave his guest his daughter in marriage and made him his heir

150 Later tradition records that Bellerophon presumptuously tried to soar to Olympus mounted on Pegasus but that Zeus sent a gadfly which stung the horse and caused him to throw his rider to earth. Bellerophon ended his days in wretchedness but Pegasus gained Olympus

JASON AND THE ARGONAUTS, 151-163

151 The story of Jason and the Argonauts was already popular in Homer's day and has more recently been told by Kingsley in *The Heroes* and by William Morris in *The Life and Death of Jason*

152 Jason's father Aeson the rightful King of Iolcus had been deprived of his kingdom by his two half brothers Pelias and Neleus. The mother of all three was Tyro who seduced by Poseidon bore him the twins Pelias and Neleus. She exposed the twins but they were reared by a horse herd and when Tyro later married Cretheus founder and King of Iolcus they were adopted by him

153 Tyro's son by Cretheus was Aeson but on Cretheus' death Pelias imprisoned Aeson expelled Neleus and made himself supreme. The life of Aeson's infant son Jason was saved only because he was smuggled out of Iolcus and entrusted to the care of Chiron, the Centaur

154 When a young man Jason returned to Iolcus fearlessly demanding his kingdom and

Pelias to be rid of him asked him to go to Colchus to fetch the golden fleece. This the fleece of the ram on which Phrixus had escaped and which he had given to King Æetes of Colchus was now hanging on an oak tree in the grove of Ares guarded night and day by a sleepless dragon.

155 Jason welcomed the enterprise and commanded Argus the Thespian to build him a fifty oared ship called the *Argo* into whose prow Athene herself fitted an oracular beam. Most of the heroes of the day flocked to join Jason and his crew included the Dioscuri Castor and Polydeuces Heracles and Orpheus the musician.

156 They met many adventures on the way. After lingering too long with the women of Lemnos they slipped through the Hellespont and reached Mysia. Here Hylas the squire of Heracles while fetching water was stolen away by the Naiads leaving nothing but an empty pitcher and Heracles left the *Argo* in a vain search for him.

157 On the island of Bebrycos the Argonauts were met by its king Amycus son of Poseidon and a renowned boxer who contrived to kill all strangers by challenging them to a boxing match but Polydeuces met the challenge and killed the bully. In Thrace they freed the blind king and prophet Phineus from a plague of Harpies and in gratitude he advised Jason how to navigate the Bosphorus. At its entrance were the perilous floating islands the Symplegades. It is possible that rumours of icebergs gave rise to the fable of these islands which clashed together and crushed any ship which attempted to pass between them. But Jason following the advice of Phineus released a dove and the *Argo* slipped between the islands as they recoiled. Henceforth they remained fixed. After overcoming other dangers the Argonauts at last reached the River Phasis and Colchus.

158 Here Æetes promised that he would give Jason the fleece if he could yoke together two fire-breathing bulls with brazen feet the work of Hephestus plough the field of Ares and sow it with the dragon's teeth left over by Cadmus at Thebes. It was Medea who enabled Jason to perform this terrible task. This sorceress princess the daughter of Æetes by his first wife fell instantly in love with Jason and promised to help him if he would swear by all the gods to marry her and be faithful. She gave him a fire-resisting lotion and he completed the task. Then when Æetes failed to keep his promise Medea charmed the dragon to sleep while Jason took down the fleece and they fled together in the *Argo*.

159 The furious Æetes pursued them but Medea ruthlessly murdered the young half brother Absyrtus she had brought with her and cut him into pieces which she dropped one by one over the side of the boat. Æetes stopping to collect the fragments for burial soon lost sight of the fugitives.

160 There are many conflicting accounts of the *Argo's* return journey but none of them is feasible for the Greek knowledge of geography was at that time very limited. Tradition said that the ship reached the Western Mediterranean and visited the island of Circe who purified Jason and Medea of murder.

161 On their return to Iolcus they found that Pelias had forced Æson to take his life though one tradition mentioned by Ovid and by Shakespeare in *The Merchant of Venice* says that he was renewed to youthful vigour by Medea. All agree that Medea took a terrible revenge on Pelias. She persuaded his daughters with the exception of Alcestis to cut their father up and boil him in a cauldron promising falsely that this would rejuvenate him. Pelias son Acastus horrified at the murder then expelled Jason and Medea and they repaired to Corinth.

162 For many years they lived happily until they were involved in the final tragedy dramatised by Euripides in his *Medea*. Jason deserted

Medea for Clauce also called Creusa daughter of Creon and the sorceress sent the young bride a garment which consumed her in flames set fire to the palace and involved Creon also in death. Some say that Medea also killed her own children by Jason.

163 Medea then escaped in a chariot drawn by winged serpents and took refuge with Ægeus of Athens who married her. But on Theseus' arrival in the city Medea departed and after many wanderings became an immortal. Sometimes that Jason took his own life others that he was mercifully killed when the poop of his own ship *Argo* fell upon him.

HERACLES 164-202

164 Heracles the most famous of the Greek heroes was the son of Alcmena by Zeus.

165 Alcmena's brothers having been killed by the Taphians she would not consummate her marriage with her husband Amphitruon son of Alceus until he had avenged their death. While Amphitruon was away from Thebes fighting the Taphians Zeus visited Alcmena in her husband's likeness and told her how he had been victorious. The true Amphitruon returned the following day and the ensuing confusion is the theme of comedies by Plautus Molière and Dryden.

166 Nine months later Zeus boasted that he was about to become the father of a son who would be called Heracles or glory of Hera and who would be ruler of the house of Perseus. The jealous Hera exacted from him a promise that any son born that day to the house of Perseus should be king. She then hastened the birth of Eurystheus who was a grandson of Perseus and delayed that of Heracles. Alcmena bore two children Heracles son of Zeus and Iphicles Amphitruon's son who was a night younger. Alcmena fearing Hera exposed Heracles but Hera in error nursed him thus conferring on him immortality.

167 Returned to Alcmena Heracles prospered and when still in his cradle strangled with either hand two terrible snakes which Hera had sent to destroy him. In his youth he was taught how to drive the chariot by Amphitruon fighting by Castor how to sing and play the lyre by Eurystheus wrestling by Antiochus and archery by Eurystus. Linus who was once teaching him to play the lyre censured him and Heracles then promptly killed his teacher with his own lyre so Amphitruon sent him away to keep cattle.

168 In his eighteenth year he set out to attack the lion of Mt. Cithæron which was destroying the herds of both Amphitruon and his neighbour Thespius. The chase lasted fifty days and Thespius who was Heracles' host all this time rewarded him by giving up his fifty daughters to him. Heracles killed the lion with a wild olive club and made himself a garment of the pelt with the head as helmet though some say that he wore the skin of the Nemean lion.

169 On his return to Thebes Heracles challenged the Myrian heralds from Orchomenus who had come to collect tribute of cattle and then led a victorious campaign against the Myrians in which his foster father Amphitruon was killed.

170 Heracles was rewarded by Creon King of Thebes who gave him his eldest daughter Megara or Megera in marriage and Heracles became by her the father of several children. Creon's youngest daughter was married to Iphicles.

171 But Hera now visited Heracles with madness so that he killed his own children and two of Iphicles. When he recovered his reason he went after purification to consult the oracle at Delphi. The Pythia calling him for the first time Heracles advised him to go to Tiryns and there serve Eurystheus King of Argos for twelve years doing whatever he was commanded. At the end of that time immortality would be conferred on him.

172 Most reluctantly Heracles set out. The gods gave him gifts of armour but he relied on his bow and arrows and on the olive clubs which he cut for himself. His nephew Iolaus, oldest son of Iphicles accompanied him as his faithful charioteer and companion. Thus supported Heracles embarked on the twelve gigantic tasks imposed on him by Eurystheus.

The Twelve Labours of Heracles

173 The First Labour was to bring back the skin of the Nemean or Cleonean lion, an enormous creature said to be the offspring of Typhon and Echidne which was devastating the valley of Nemea near Cleone. As the pelt could not be pierced by any weapon Heracles strangled the lion with his hands. He rededicated the Nemean games to Zeus and took the lion's carcass back to Tiryns where he flayed it with its own claws. Some say that he wore the pelt as his armour. Eurystheus was so terrified that he now took refuge in a brazen urn below the earth whenever Heracles approached.

174 The Second Labour was to kill the Lernean Hydra, another monster which was said to be the offspring of Echidne by Typhon and which Hera brought up. It lived at the sevenfold source of the River Amymone and haunted the neighbouring swamp of Lerna. It had a dog-like body and nine snake heads, one of them immortal. As soon as Heracles struck off one head with his club, two grew in its place, while an enormous crab seized the hero's foot. He crushed the crab and called on Iolaus to burn the necks of the eight heads as he crushed them. The immortal head was buried and Heracles poisoned his arrows in the monster's gall, so that henceforth any wound they caused was fatal. Hera placed the image of the crab among the signs of the zodiac.

175 The Third Labour was to capture alive the Cerynean Hind. This creature had brazen feet and golden antlers and was therefore often called a stag. Heracles pursued it tirelessly for a year and eventually shot an arrow which pinned the forelegs together without causing bloodshed. He then carried the creature back on his shoulders.

176 The Fourth Labour was to capture alive the Erymanthian boar which had come down from Mt Erymanthus to ravage Pholus. During his journey Heracles was entertained by the Centaur Pholus who had a cask of wine given by Dionysus. When this was opened other Centaurs besieged the cave. Repulsed by Heracles, some of them fled to the Centaur Cheiron. Heracles accidentally wounded Cheiron who was an old friend with one of his poisoned arrows. Cheiron, an immortal, could not die although he now longed to do so and was relieved from pain only when he later surrendered his immortality to Prometheus. Heracles continued his pursuit of the boar, drove it into a snow drift, bound it with chains and carried it to Eurystheus, but when he heard that the Argonauts were gathering for Colchus he hastened to join them accompanied by Hylas.

177 The Fifth Labour was to cleanse in one day the stables of Augeas, King of Elis, who had more cattle and sheep than any man on earth. The dung had not been cleared away for years. Heracles swore a bargain with Augeas that he would cleanse the stalls in one day in return for a tenth of the cattle and Phyleus, son of Augeas, was a witness to their mutual oaths. Heracles then diverted the Rivers Penelus and Alpheus through the stalls which were thus cleansed in a day. But Augeas now learned that Heracles had been under Eurystheus' orders and therefore refused the reward and even denied the bargain. When Phyleus was loyal to the truth, Augeas banished him. Heracles later avenged himself on Augeas.

178 The Sixth Labour was to free the marshy lake of Stymphalia in Arcadia of the Stymphalian birds which were sacred to Ares. These man-eating creatures had brazen beaks, claws and wings and used their feathers as arrows.

Heracles helped by Athene frightened the birds with a rattle and then shot them down, though some say that they flew off to the island of Aetna in the Black Sea where they were found later by the Argonauts.

179 The Seventh Labour was to capture the Cretan bull. Poseidon had sent the bull to Minos for a sacrifice but he had substituted another and it was now raging over the island. Heracles did not avail himself of Minos' offers of help but captured the bull single-handed and took it to Eurystheus who set it free again. It roamed through Greece to Marathon where Theseus captured it and took it to Athens for sacrifice to Athene.

180 The Eighth Labour was to bring back the mares of Diomedes, a savage King of the Hestones in Thrace who fed his horses on human flesh. On his way Heracles visited Admetus and freed Alceste from death. Then with a few companions he drove the mares down to the sea and turning to repel the attacking Bistones he left them in the charge of his friend Abderus who was soon eaten by them. Heracles however killed Diomedes and threw his body to the mares. He then founded the city of Abdera in honour of his friend and drove the mares back to Eurystheus who set them free on Mt Olympus where they were eaten by wild beasts.

181 The Ninth Labour was to fetch for Admetus, daughter of Eurystheus, the golden girdle that Hippolyte, Queen of the Amazons, had received from Ares. After an eventful journey through Europe and Asia, Heracles and his companions reached the land of the Amazons where Hippolyte, sister of Antiope, received him kindly and promised him the girdle. But Hera roused the Amazons and they attacked Heracles. In the fight he killed their leaders and Hippolyte herself from whom he took the girdle. On his way home Heracles came to Troy where he rescued Laomedon's daughter Hesione from a sea monster sent by Poseidon.

182 The Tenth Labour was to fetch the oxen of Geryon without either demand or payment. Geryon, a powerful monster with three bodies lived on the island of Erythra. Its site was disputed. Some said it was beyond the ocean stream identified it with Gades. Heracles travelled to the frontiers of Libya and Europe where he set up two pillars, Calpe and Abyla, on the two sides of the Straits of Gibraltar, hence called the Pillars of Hercules. When Helios shone too brightly Heracles shot at him with an arrow and Helios, admiring such boldness, gave him a golden cup or boat in which he sailed to Erythra. Geryon's cattle were guarded by the two-headed dog Orthrus and to be the offspring of Typhon and Echidne and the herdsmen Eurytion, son of Ares. Heracles felled both of these with his club and after overcoming Geryon he sailed with the cattle to Tartessus in Spain where he returned the golden boat to Helios. On his adventurous journey back through Gaul, Italy, Illyricum and Thrace he resisted many attempts such as that of Cacus to steal the cattle and eventually handed them over to Eurystheus who sacrificed them to Hera.

183 The Eleventh Labour was to fetch the golden apples of the Hesperides. These grew on the tree which Hera had received from Gaia at her wedding and which she had planted in a garden on Mt Atlas. It was guarded by the Hesperides and the dragon Ladon, another offspring of Typhon and Echidne. Heracles first consulted Proteus or as some say Prometheus and following the advice he received he persuaded Atlas to fetch the apples while he himself upheld the celestial globe. According to some he also shot Ladon. Atlas, returning with three apples, tried to avoid taking back the burden of the globe but Heracles by a ruse transferred the globe back to the giant's shoulders, took the apples and hastened away. On his return journey he killed the giant Antaeus and also persuaded Zeus to free Prometheus the arrow with which Apollo shot the vulture being placed among the stars as

Sagitta Eurytheus made Heracles a gift of the apples but the hero dedicated them to Athena who returned them to their rightful place

184. The Twelfth Labour was to bring back the dog Cerberus from Tartarus the most difficult task of all. Heracles descended from Tænaron in Laconia and was guided by Athena and Hermes. After he had crossed the Styx and freed his friend Theeus and Ascalaphus he obtained Hades permission to carry away Cerberus provided he could do so without using any weapon. Heracles seized Cerberus by the throat and dragged him up to show Eurytheus. He then carried the monster back to Tartarus.

185. According to most writers Heracles now returned to Thebes and gave his wife Megara to his nephew Iolaus but Euripides in his play *Heracles* uses a different version. He represents the hero first killing the tyrant of Thebes who had attempted to kill Megara and her children and then driven insane by Hera himself killing his wife and family.

186. Heracles now desired to marry Iole daughter of his friend Eurytus King of Oechalia. Eurytus had promised her to the man who could surpass him and his sons in shooting with the bow. Though Heracles surpassed them all Eurytus still refused to give him Iole because he had murdered his own children and in this Eurytus was supported by all his sons except Iphitus. Later when Iphitus appeared suspicious of him Heracles in a fit of rage slew him. Though purified from this murder he was still troubled in mind and consulted the Delphic Oracle. He was advised to serve as a slave and to give the proceeds to the family of Iphitus.

187. Heracles was purchased by Omphale Queen of Lydia and widow of Tmolus and he served her either for one or for three years. Later writers say that he lived effeminately at this time and that he used to change garments with Omphale but others say that he continued to perform heroic deeds.

188. His period of servitude to Omphale completed Heracles sailed against Troy. On a previous occasion probably when returning from the land of the Amazons Heracles and his friend Telamon had come to Troy where they had found Laomedon's daughter Hesione exposed naked to a sea monster sent by Poseidon (see para 104). Heracles had freed Hesione and killed the monster but Laomedon had refused to give him the reward he had promised the white horses given by Zeus in exchange for Ganymede.

189. Heracles and Telamon therefore now sailed to Troy to take their revenge. How they sacked the city is described in para 275. Hesione was given to Telamon and bore him the son Teucer. On his return Heracles faced a terrible storm raised by Hera and perils on the island of Cos. He was then led by Athena to Phlegra, where he helped the gods in their battle with the giants.

190. Heracles now took his revenge on Augeas who had refused him payment for cleaning the stables. He invaded Elis and eventually killed Augeas his sons and their allies the Moliones though some say that he spared Augeas. He then founded the Olympic Games and fetched from the source of the Danube the wild olive tree whose leaves should crown the victor. Heracles then destroyed the city of Pylos which had helped Elis. He killed Neleus the king and all his sons except Nestor.

191. Heracles next marched against Hippocoon who had fought against him under Neleus. Hippocoon had driven out his brother Tyndareus and seized the kingdom of Sparta. Heracles killed him and all his sons and restored Tyndareus. He was helped in this enterprise by Cepheus and his twenty sons but Cepheus and seventeen sons were killed. It was about this time that Heracles seduced the priestess Auge daughter of Aleus

King of Tegea and became by her the father of Telephus.

192. After four years in Arcadia Heracles left for Atolia where Ceneus was King of Calydonia and Pleuron. Heracles wished to marry Ceneus' daughter Deianira and won her by defeating Achelous the mighty river god son of Oceanus and Tethys. He now sent Iolaus as leader of his sons by the daughters of Thespius to settle in Sardania.

193. Three years later while at a feast Heracles accidentally killed the boy Eunomus and went into voluntary exile taking Deianira and their son Hyllus.

194. They reached the River Evenus across which the centaur Nessus carried travellers for a small fee. Heracles let Nessus carry Deianira while he himself swam but the centaur galloped off with her and would have violated her if Heracles had not shot him through the breast. The dying centaur then told Deianira to take his blood as a charm to keep Heracles' love.

195. Heracles now resided at Trachis and from there invaded Oechalia with an army in order to avenge himself on Eurytus who had refused to surrender his daughter Iole even though Heracles had won her in the archery contest. The hero killed Eurytus and all his family and sent Iole to Deianira in Trachis while he visited Ceneus in Euboea and prepared a thanksgiving sacrifice to Zeus.

196. He had sent Lichas to Deianira to fetch a white shirt to wear at the ceremony. Deianira fearful that Iole might win Heracles' love rubbed the shirt in Nessus' blood not knowing that Heracles' arrow steeped in the Hydra's blood had poisoned it. When Heracles put the shirt on it burned with excruciating agony into his body and attempts to tear it off took his flesh with it. Heracles seized Lichas and flung him into the sea and then commanded his son Hyllus to take him to Trachis. Deianira against at what she had unintentionally done hanged herself. Heracles asked Hyllus to promise to marry Iole and to build him a funeral pyre on Mt. Oeta.

197. This tragic climax to Heracles' career has been dramatised by Sophocles in the *Women of Trachis* or *Trachiniae* where Deianira's distress at Iolaus' arrival and her ill-fated ruse to keep her husband's love are touchingly represented.

198. Heracles finally ascended his funeral pyre to be burned alive. To Philoctetes who kindled the flame he gratefully bequeathed his quiver bow and arrows. Thunderbolts demolished the pyre and Heracles was carried by a cloud to Olympus. There he became immortal. Hera was persuaded by Zeus to adopt him as her son, and reconciled to her at last he married her daughter Hebe.

The Children of Heracles or Heracleidae

199. Eurytheus now determined to expel from Greece Alcmena and all the children of Heracles. Only in Athens did they find protection and when Eurytheus attacked the city he was resisted by Theseus (or by his son Demophon). Iolaus and Hyllus. As an oracle had demanded the sacrifice of one of Heracles' children his daughter Macaria killed herself. Eurytheus was then defeated by either Iolaus or Hyllus and despatched by Alcmena.

200. These events are the theme of Euripides' play *The Children of Heracles* or *Heracleidae*.

201. Hyllus later endeavouring to enter Peloponnesus was slain in single combat by Echemus King of Tegea. Only Telepolemus settled in Argos.

202. Some generations later the descendants of Heracles conquered Peloponnesus in conjunction

with the Dorians This legend indicates the conquest of the Achaeans by the later invaders

THESEUS, 203-218

203 Theseus the great hero of Attica was the son of Æthra by Ægeus King of Athens though he was also reputed to be the son of Poseidon Æthra was the daughter of Pittheus King of Troezen and here she secretly brought up her young son

204 When he was of age Æthra showed him the sandals and a sword which was an heirloom of Cecrops that Ægeus had left for him under a great rock Theseus was able to lift the rock recover the tokens and proceed to Athens

205 He insisted on going not by sea but by the dangerous land route and like Hercules he freed the country of many terrors He killed Peirithetes whose club he afterwards carried Sinus the wild sow of Crommyrum Sciron Cercyon and Sinus father Polypemon who was surnamed Procrustes

206 Meanwhile in Athens Ægeus had married Medea who had fled for safety from Corinth Medea recognised Theseus and jealous for Medus her son by Ægeus she attempted to poison him But Ægeus recognised Cecrops sword in time and welcomed his son with great rejoicing Medea fled taking Medus and Theseus then scattered other rivals the fifty sons of Pallas nephews of Ægeus who had hoped to succeed him to the throne

207 Theseus next captured and sacrificed to Athens the Marathonian bull which Hercules had brought from Crete and which had been driven to Marathon

208 He now of his own free will went as one of the seven youths who with seven maidens were chosen by lot to be sent to Crete as yearly tribute to be devoured there by the Minotaur But Ariadne daughter of Minos King of Crete fell in love with Theseus and gave him a sword and a clue of thread by which he might find his way out of the labyrinth where the Minotaur lived Theseus slew the monster released his fellow Athenians and fled with them and Ariadne but at Naxos he deserted her and she was consoled by Dionysus to whom the island was sacred

209 Theseus forgot on his return to hoist the white sail which was to have been a sign of victory and Ægeus seeing the black sail threw himself in despair into the sea now called Ægean Theseus then became the King of Athens

210 He is said to have invaded the country of the Amazons either with Hercules or later and here he carried off Antiope who became his wife though according to another tradition Theseus took not Antiope but her sister Hippolyte It is Hippolyte who appears as his bride in *The Midsummer Night's Dream* In revenge the Amazons invaded Attica and were eventually defeated by Theseus in the midst of Athens itself

211 Later Theseus married Ariadne's sister Phaedra another daughter of Minos who bore him the sons Acamas and Demophon But Phaedra fell desperately in love with her step son Hippolytus (Theseus son by either Antiope or Hippolyte) and when the young man rejected her advances she killed herself after leaving a letter falsely accusing him to Theseus The enraged Theseus prayed to Poseidon that Hippolytus might die that very day and the god sent a sea monster which so terrified the chariot horses of Hippolytus that they dragged him to death The story is the theme of Euripides tragedy *Hippolytus* and the *Theatre of Racine*

212 Theseus was a close friend of Pirithous King of the Lapithae and attended his wedding to Hippodameia, and when a drunken Centaur attempted to carry off the bride Theseus joined

with the Lapithae in the famous fight against the Centaurs

213 After Hippodameia's death Pirithous and Theseus together carried off the girl Helen of Sparta and she fell by lot to Theseus As she was too young to marry he concealed her in the village of Aphidne where she was cared for by his mother Æthra

214 Theseus then full of misgiving fulfilled his promise to Pirithous to help carry off another daughter of Zeus by accompanying him to the Underworld to take away Persephone But Hades chained them both to a rock where they languished till Hercules came to the Underworld and released Theseus only (see para 184)

215 Meanwhile Helen's brothers the Dioscuri Castor and Polydeuces invaded Attica and being told by Acadamus where Helen was hidden they rescued her taking Æthra as her slave

216 When Theseus returned from Tartarus he was unable to keep order among his people who were being stirred up against him by Menestheus He retired to the island of Syros where he was treacherously killed by King Lycomedes He nevertheless returned in spirit to help the Athenians at the Battle of Marathon and though Menestheus succeeded Theseus as king the sons of Theseus were afterwards restored to the throne

217 Theseus like Hercules took part in the heroic enterprises of his age He joined in the Calydonian hunt and helped Adrastus at Thebes and he may have been one of the Argonauts

218 Although Athenians in later times looked on Theseus as an historical figure ascribing political institutions to him he was in fact a legendary hero

CRETAN MYTHS 219-239

219 Recent archaeological discoveries have indicated that many of the ancient legends concerned with Crete have a factual basis and a very readable book on the subject is the *Pan Book Bull of Minos* by Leonard Cottrell

220 In 1899 Sir Arthur Evans began his excavations at Knossos and soon unearthed the remains of the magnificent unfortified and labyrinthine so called Palace of Minos with its indications of an elegant and highly artistic civilisation

221 From the architectural evidence available scholars now consider that there existed in Crete between 2500 and 1400 B.C. a Minoan pre-Hellenic culture which had affinities with that of Egypt This maritime commercial culture its sea power making fortification unnecessary spread to the mainland of Greece where it became known as Mycenaean It is in fact possible that Crete may have exercised some kind of suzerainty over the mainland The Cretans probably worshipped a goddess who was served by priestesses The favourite sport was bull fighting in which men and women toreadors showed amazing skill Cretan architects and engineers were exceptionally ingenious

222 Discoveries such as these give special significance to such legends as that of Minos sea power and of Crete's exaction from Athens of a tribute of men and maidens for the Minotaur Again the constant appearance of the bull in Cretan legend and Daedalus' building of the labyrinth appear to have foundation in historical fact

223 It was to Crete that Zeus in the form of a bull brought Europa said to be the daughter of Agenor son of Poseidon and King of Phoenicia and of his wife Telephassa

224 As the lovely Europa was playing on the sea shore with her maidens Zeus appeared as a white bull and she dared to climb on his back, an incident depicted in the masterly painting by

Paul Veronese in the Palace of the Doges in Venice. Suddenly Zeus plunging into the sea carried off Europa to Crete where he fathered on her the three sons Minos Rhadamanthus and Sarpedon. When the reigning king later married Europa he adopted her three sons as his heirs.

225 The brothers quarrelled however over the boy Miletus son of Apollo. As Miletus preferred Sarpedon they both fled from Minos to Asia Minor. Here Miletus founded the kingdom that bore his name and Sarpedon after aiding Cilix King of Cilicia against the Lycians became king of the latter and was permitted by Zeus to live for three generations.

226 Rhadamanthus though at first ruler of part of Crete also found it wise to flee. He went to Boeotia and on Amphitrión's death married Alcmene. So just a ruler did he prove that he became one of the judges of the Underworld.

227 Minos now sole ruler of Crete was confirmed in his power by Poseidon who sent him a magnificent white bull. This so delighted the king that he withheld it from sacrifice and when it later ran savage it was captured by Hercules as his Seventh Labour and eventually slain by Theseus.

228 Minos was the law giver to Crete and was helped in the defence of the island by Talos a bull-headed brazen giant and by his powerful fleet.

229 Curious legends are told of Minos' loves. One was Procris another Britomartis a Cretan nymph whom he pursued for nine months until she leaped into the sea and was deified by Artemis sharing with her the epithet Dictynna.

230 Once when Minos was besieging Nisa, the port of Megara which belonged to King Nisus, Scylla Nisus' daughter fell in love with him and killed her father by cutting off the hair on which his life depended. Although Scylla let him into the city Minos was so horrified at her parricide that he left her and she swam after his ship until her father's soul changed to a sea eagle pounced on her and she was turned to the bird Cris. Others say that Minos drowned Scylla and she was turned into the fish Cris. She has sometimes been confused with Scylla the daughter of Phorcys.

231 The wife of Minos was Pasiphaë daughter of Helios and Perse and several of their children, as Glaucus Androgeos Ariadne and Phædra were the subject of legend.

232 Glaucus when a boy was drowned in a cask of honey and his body found by the seer Polydeus. Unable to resuscitate Glaucus Polydeus was entombed with him but here a serpent revealed a herb which restored Glaucus to life and the seer and the boy were released.

233 Androgeos won every contest in the Pan-athenais games and was slain at the instigation of Ægeus. Minos in revenge exacted from Athens a yearly tribute of seven youths and maidens to be devoured by the Minotaur.

234 This monster with bull's head and man's body was the offspring of Pasiphaë and the white bull Dædalus the craftsman had enabled her to satisfy her desire and afterwards built the labyrinth in which her shameful offspring was housed.

235 When Ægeus son Theseus voluntarily joined the youths destined for the Minotaur Ariadne fell in love with him and enabled him to kill the monster by giving him a sword and a clue of thread by means of which he found his way out of the labyrinth. Ariadne then escaped with Theseus but was deserted by him on Naxos, where she was found by Dionysus as depicted in Titian's *Bacchus and Ariadne* in the National Gallery. Tintoretto's picture in the Doge's Palace in Venice shows the marriage of Ariadne to the god.

236 Her sister Phædra was later married to Theseus and her unrequited passion for her step-

son Hippolytus and its tragic outcome has been described in para. 211.

237 The cunning Dædalus whose craftsmanship was symbolic of the latest development in sculpture and architecture had been welcomed by Minos after his flight from Athens. The legend runs that he had been so bitterly jealous of his nephew Talos or Perdix inventor of the saw, chisel and compasses that he threw him headlong from Athens temple on the Acropolis. Athens changed Talos into the bird perdix or partridge and the Areopagus banished Dædalus.

238 Welcomed to Crete he found his skill greatly valued by Minos until the king discovered how he had aided Pasiphaë. Minos then imprisoned Dædalus with his son Icarus in his own labyrinth. They were released by Pasiphaë and Dædalus made wings fastened to the shoulders with wax on which they flew away. Icarus mounted too high the sun melted the wax and he was drowned in the Icarian Sea but Dædalus reached Cumæ near Naples and fled thence to Sicily. Here Cocalus welcomed him and when Minos pursued the craftsman, Cocalus' daughters enabled him ingeniously to kill the king.

239 After Minos' death although his son succeeded him Cretan civilisation collapsed. Minos himself became a judge in the Underworld.

THEBAN MYTHS 240-271

240 The legend concerning the origin of Thebes is that of Cadmus who according to common tradition was the son of Agenor son of Poseidon and the King of Phœnicia and of his wife Telephassa.

241 The sister of Cadmus Europa was one day carried off by Zeus who appeared to her in the form of a bull (as is described in para. 224) and Agenor sent Cadmus in search of his sister.

242 Unable to find her Cadmus consulted the Delphic oracle who advised him to relinquish his search but to follow a cow and build a town where she should sink down with fatigue. Cadmus followed the cow from Phœcis to Boeotia and where she rested he built Cadmea later the citadel of Thebes.

243 Making sacrifice to Athene he sent his men for water from a spring of Ares not knowing that it was guarded by a dragon which killed most of his men. When Cadmus had killed the dragon Athene advised him to sow its teeth and immediately there sprang up fully armed the Spartoi or Sown Men who fought with each other till only five survived—Echion, Udeus, Chthonius, Hyperenor and Pelorus. These five were the ancestors of Thebes and with their help the Cadmea was built.

244 Zeus gave to Cadmus as wife Harmonia daughter of Ares and Aphrodite and the Olympian deities attended the wedding. Harmonia received as a gift from Aphrodite the famous necklace made by Hephaestus which Zeus had originally given Europa and which conferred irresistible loveliness upon its wearer. From Athene she received a magic robe which conferred divine dignity. The children of Cadmus and Harmonia were Autonoe, Ino, Semele the mother of Dionysus, Agave, Polydorus and later Illyrius.

245 It is said that Cadmus introduced to Thebes from Phœnicia the use of letters.

246 In old age Cadmus resigned the throne to Pentheus his grandson the son of Agave and Echion. But Pentheus resisting the worship of Dionysus was destroyed by Agave and her sisters Autonoe and Ino as is depicted in *The Bacchæ* of Euripides.

247 Cadmus and Harmonia then left Thebes and were later in the form of serpents received in the Islands of the Blessed.

248 Another legend concerning Thebes is that of Amphon and Zethus the twin sons of Antiope by Zeus

249 Antiope was divorced by her husband Lycus of Thebes and cruelly treated by his second wife Dirce. Meanwhile Amphon and Zethus were brought up by cattle men on Mt. Cithæron. When they were old enough to know what had happened they took their revenge. They killed Lycus and Dirce who was tied to the horns of a wild bull and her body thrown into a fountain which henceforth bore her name and then took possession of Thebes.

250 Amphon and Zethus now built the lower fortifications below the Cadmea and so skilfully did Amphon play on the lyre given him by Hermes that the stones moved into place of their own accord. The brothers ruled jointly. Zethus married Thebe who gave her name to the city and Niobe became the wife of Amphon.

251 Niobe the proud daughter of Tantalus and sister of Pelops had seven sons and seven daughters and boasted that she was superior to Leto who had only two children. As punishment to her Apollo killed the boys with his arrows and Artemis the girls and Niobe all tears were turned by Zeus into a stone on Mt. Sipylus. The crag of Niobe being sunstruck appears to weep when the sun strikes the snow. It is said the Amphon also was either killed by Apollo or that he took his own life.

252 Most famous of Theban kings was Œdipus who claimed direct descent from Cadmus through Polydorus, Labdacus and Laus and all three of the great Greek tragic dramatists were inspired by the fateful story of Œdipus and his children.

253 Œdipus the son of Laius King of Thebes and of his wife Jocasta was as a new born child exposed on Mt. Cithæron his feet tied together and pierced with a nail for Laius had learned from the oracle at Delphi that he would be killed by his own son. Found by a shepherd of Polybus King of Corinth the child was called from his swollen feet Œdipus and was reared by Polybus as his own son.

254 When Œdipus grew to manhood he was told by the Delphic oracle that he was destined to kill his own father and marry his mother and he resolved never to return to Corinth. But going from Delphi he met Laus riding in a chariot and in a quarrel killed him.

255 Laus had been on his way to ask the Delphic oracle how he could rid Thebes of the Sphinx a winged lion with the head and breast of a woman. This monster was said to be the offspring of Typhon and Echidne or of Orthrus and the Chimæra. Seated on a rock she challenged each wayfarer with her riddle and strangled him when he failed to solve it.

256 Œdipus arriving in Thebes heard the Sphinx's riddle. Which being having only one voice has sometimes two feet sometimes three and sometimes four and is weakest when it has most. Œdipus answered rightly that the being was man who crawls in infancy and supports himself with a staff in old age and the Sphinx thereupon flung herself to death.

257 As the Thebans had promised that whoever should vanquish the Sphinx should become king and marry Jocasta Œdipus became King of Thebes and had four children by his own mother. Eteocles, Polyneices, Antigone and Ismene.

258 Thebes thus defiled by murder and incest was visited by plague and the blind seer Teiresias said that the city would be saved when one of the Sparti (a title given also to descendants of the Seven Men) should give his life. When he learned this Menœceus father of Jocasta leapt from the walls to his death.

259 The plague still raging Œdipus consulted Teiresias and it is at this point that the famous

Œdipus Tyrannus of Sophocles begins. Œdipus was horrified when at last convinced of his unconscious guilt and after Jocasta had hanged herself he blinded himself with a pin taken from her garment and prayed her brother Creon to banish him.

260 Eventually Œdipus went into exile accompanied by Antigone and followed later by Ismene. At Colonus in Attica he found refuge in a grove of the Eumenides and protected by Theseus was received at last by the gods. These last hours of Œdipus are most touchingly presented by Sophocles in his *Œdipus at Colonus*.

261 Angered by his sons neglect Œdipus had cursed them saying that they should divide their inherited land by the sword. They therefore agreed to rule in turn but when Eteocles term had expired he refused to abdicate. Polyneices then sought the help of Adrastus son of Talauus and King of Argos whose daughter Argia he married while her sister Deipyle married Iphedus (son of Eneus of Calydon) who on account of some murder he had committed was also a fugitive.

262 When Adrastus prepared to restore Polyneices his brother in law the seer Amphiarus prophesied death for all the leaders save Adrastus. Amphiarus had married Adrastus' sister Eriphyle and Polyneices following the advice of Iphedus bribed Eriphyle giving her the famous necklace of Harmonia on the condition that she would persuade her husband to join the expedition.

263 Adrastus, Amphiarus, Polyneices and Tydeus were joined by Capaneus, Hippomedon and Parthenopæus the son of Meleager and Atalanta and these seven marched against Thebes. The war that followed was dramatised by both Æschylus in his *Seven against Thebes* and by Euripides in *The Phœnician Maidens*.

264 After Thebes had suffered initial reverses Teiresias prophesied that a royal prince must sacrifice himself and a second Menœceus the son of Creon now took his own life.

265 The attackers were soon repelled. Capaneus scaling the walls was struck by Zeus with lightning. Tydeus wounded by Melanippus might have been saved by Athens with an elixir given her by Zeus but Amphiarus who bore him a grudge persuaded him to drink the brams of the dead Melanippus. Thus so disgusted Athens that she left him to his fate. Hippomedon and Parthenopæus also having been killed offered to settle the dispute in single combat with Eteocles but both were mortally wounded. Amphiarus fled in his chariot and the earth opened and swallowed him. As the seer had prophesied Adrastus was the only one of the seven left alive.

266 Thebes was not unscathed. The *Antigone* of Sophocles opens at the point where Creon refused to allow burial to Polyneices. The courageous Antigone dared to disobey him and he ordered that she should be imprisoned alive in a cave. Here she hanged herself and Creon's son Hæmon to whom she was betrothed took his own life in despair.

267 Euripides in *The Suppliants* dramatises the next phase of the story. Since the Thebans had refused burial to their fallen enemies Adrastus and the mothers of the slain went to Eleusis and secured the help of Theseus. He defeated the Thebans and the bodies of the Argives received burial rites but Evadne daughter of Iphis and wife of Capaneus threw herself on to the flaming pyre and perished.

268 Thebes was again attacked ten years later when Adrastus assembled the Epigoni the descendants of the Seven. His own son Ægeus made one and also Diomedes son of Tydeus with his faithful companion Stenæleus son of Capaneus and Evadne.

269 Since Alcmaeon like his father Amphiarus was unwilling to join the Epigoni. Thersander followed the example of his father Polyneices in

once more bribing Eriphyle this time with the magic robe of Harmonia she then persuaded Alceon to join the expedition along with his brother the seer Amphilochus

270 Egealeus was killed before the walls of Thebes and Teresias then advised the Thebans to evacuate the city and himself accompanied them though he died next dawn on drinking from the well of Tiphussa That day Adrastus hearing of Egealeus death also died of grief and in accordance with Teresias prophecy the Argives took the empty city

271 Alceon on return slew his mother Eriphyle in revenge for her vanity and deceit towards his father and himself Pursued by the Lemnians he fled to Philegus King of Psophis who purified him and gave him his daughter Anisot in marriage Alceon gave his wife Harmonia's necklace and robe but was soon forced by the Lemnians to flee once more He was next purified by the river god Achelous and married his daughter Callirrhoe who soon demanded the necklace and robe Alceon daring to revisit Psophis obtained them from Philegus on the pretext of taking them to Delphi but when Philegus discovered that they were destined for Callirrhoe he ordered his sons to slay Alceon Finally Philegus himself sent the ill fated treasures to Delphi

LEGENDS OF TROY 272-352

272 One of the most romantic discoveries of modern times is that of the German Schliemann who trusting the descriptions of Homer excavated a site on the coast of Asia Minor near the entrance to the Dardanelles Between 1871 and 1873 he unearthed the foundations not of one Troy but of seven his most spectacular find being a hoard of exquisite gold ornaments His work proved that Troy belonged not only to legend but also to history

273 It is now considered that in the Bronze Age Troy was an important centre for trade Frequently attacked it was many times rebuilt and Greeks Cretans and Phrygians all claimed to have had a hand in establishing it In Homer's time when the sixth Troy was standing it had probably absorbed three small towns Dardania Tros or Troy and Ilum and was probably inhabited by three tribes Dardanians Trojans and Ilans whose names are all represented in the early legends of Troy's foundation

274 One of these tells how Scamander of Crete founded a colony in Phrygia and how jumping into the River Xanthus he changed its name to his own The nymph Idea bore him a son Teucer (whence the Trojans are called Teucri) and Teucer gave a piece of land to Dardanus the son of Zeus by the Pleiad Electra who built there the town of Dardania The grandson of Dardanus was Iros who became the father of Ius and also of Gany-mede whom he relinquished to Zeus for a gift of horses The son of Ius was Laomedon.

275 It was to Laomedon that Zeus assigned Apollo and Poseidon as labourers They built for him the walls of Troy and when Laomedon refused payment Poseidon sent the sea monster which would have devoured his daughter Hesione had not she been rescued by Heracles But again Laomedon refused the agreed reward—the white horses given by Zeus in exchange for Gany-mede—and Heracles returned later to sack Troy He gave Hesione to his fellow warrior Telamon and killed Laomedon and all his sons save Podarces who was ransomed by his sister Hesione and his name changed to Priam which means re deemed

276 After a few years Priam sent Antenor to demand that Telamon should send back Hesione and the Greeks scornful refusal was one of the causes of the Trojan War

277 Priam had fifty sons nineteen of them by his second wife Hecabe or Hecuba who bore him many famous children including Hector Paris Deiphobus and the prophetic twins Helenus and Cassandra Troilus may have been her son by Apollo

278 Before the birth of her second son Hecuba dreamed that she had brought forth a blazing brand and the new born child was therefore exposed on Mt Ida Brought up by a shepherd he was called Paris and later by his courage earned the name Alexander or defender of men Paris was beloved by the nymph Chloris but he deserted her as the result of a tempting suggestion of Aphrodite's

279 The occasion of this was the famous Judgment of Paris of which a Renaissance version can be seen in Rubens' picture in the National Gallery

280 The story goes that alone of all the gods Eris was not invited to the marriage of Peleus and Thetis and in revenge she flung in the golden apple of discord with the fairest inscribed upon it Immediately Hera Athens and Aphrodite disputed its possession and Zeus commanded Hermes to lead the goddesses to Mt Ida for Paris to judge the dispute

281 Although Hera promised him rule in Asia and Athens fame in war Paris gave the apple to Aphrodite who promised him as his wife the love of all women

282 Paris now discovered his parentage and was joyfully welcomed by Priam and under Aphrodite's protection sailed to Sparta

283 His sister Cassandra foretold doom but was as usual unregarded In her youth she had been loved by Apollo who had taught her the art of prophecy on condition that she became his lover But she had disappointed him and Apollo had then ordained that her prophecy should never be believed

284 Welcomed to Sparta by King Menelaus Paris fell in love with his beautiful queen Helen and in Menelaus' absence he succeeded in carrying her off to Troy with much treasure thus precipitating the Trojan War now inevitable by reason of an oath sworn by the leading chieftains of Greece to defend Helen's husband

285 Helen the daughter of Leda by Zeus had been brought up in the Court of Leda's husband Tyndareus of Sparta So lovely was she that even as a young girl she had been carried off by Theseus and Pirithous to be rescued and brought back by her brothers the Dioscuri All the nobles in Greece then became rivals for her hand and at the instigation of Tyndareus swore an oath to defend her chosen husband

286 Helen married Menelaus and when the Dioscuri were immortalised he succeeded Tyndareus as King of Sparta.

287 After Helen had fled with Paris leaving her husband and daughter Hermione Menelaus summoned the chieftains to war His powerful brother Agamemnon King of Mycenae who had married Helen's half sister Clytemnestra was leader and from the Peloponnese came also old Nestor of Pylos whose Palace has only recently been discovered Nestor was the only one of Neleus' twelve sons spared by Heracles Renowned for wisdom and eloquence he had been a courageous fighter He had defeated the Arcadians and Eleians and had taken part in the Calydonian hunt and the fight between Centaurs and Lapithae Although he had ruled over three generations he gladly joined the expedition to Troy

288 The courageous Diomedes son of Tydeus and King of Argos also came from the Peloponnese with eighty ships He had been one of the Epigoni who had taken Thebes and two fellow Epigoni came with him—Sthenelus son of Capa

neus and Euryalus the Argonaut. Teieopolamus son of Heracles the Argive who had settled in Rhodes brought nine ships and Palamedes son of Nauplius joined the muster from Euboea

289 But Agamemnon needed more distant allies and together with Menelaus and Palamedes he went to Ithaca to persuade Odysseus to join them

290 Odysseus was the son of Anticleia a daughter of the wily thief Autolyous and of Lertes King of Ithaca though some say that his father was really Sisyphus. He had won his wife Penelope daughter of King Icarus of Sparta in a foot race and when Icarus had tried to persuade Penelope to remain with him Odysseus had told her she might do as she wished. Penelope had veiled her face to hide her blushes and had followed her husband to Ithaca

291 An oracle had warned Odysseus not to join the expedition to Troy and when the envoys arrived they found him ploughing and sowing salt. But the far sighted Palamedes placed Odysseus' infant son Telemachus in front of the plough and Odysseus was tricked into revealing his sanity and joining the expedition

292 Agamemnon also welcomed allies from Salamis and Locrus. From Salamis bringing twelve ships came Great Ajax son of King Telamon a courageous fighter who boasted that he needed not the help of the gods. His half brother Peucer son of Telamon by Hesione and the best archer in Greece fought behind Great Ajax' shield. Little Ajax also fought with them. Son of Oileus King of the Locrians he was small in stature but swift of foot and skilled in throwing the spear. He brought forty ships

293 An important contingent from Southern Thessaly also sailed to Troy for Calchas a iene grade prophet from Troy foretold that the city could not be taken without the help of Achilles son of Peleus King of the Myrmidones at Phthia in Thessaly and of the Nereid Thetis

294 By dipping her son into the Styx Thetis had made him invulnerable except for the heel which she was holding. Achilles had been taught by Cheiron and by his tutor Phoenix and was renowned for strength speed and high courage

295 Thetis knowing that if Achilles went to Troy he would never return alive sent him disguised as a girl to the Court of Lycomedes King of Scyros and here Lycomedes daughter Deidamia bore him the son Neoptolemus or Pyrrhus. When Odysseus accompanied by Nestor and Ajax visited Scyros he left a spear and shield among a pile of gifts for the maidens and Achilles seizing these revealed his identity

296 Achilles joined the Greeks together with his tutor Phoenix and Patroclus his cousin who had come as a boy to Peleus' Court after an accidental murder and had become the inseparable friend of Achilles

297 The Greeks were further strengthened by Idomeneus King of Crete who brought 100 ships and shared the command with Agamemnon. Meriones accompanied Idomeneus

298 The fleet was fortunate in being abundantly supplied with provisions by Anius son and priest of Apollo in Delos for his three daughters who had been dedicated to Dionysus received from the god power to produce at will corn oil and wine

299 The expedition set out from Aulis but first made a false landing and ravaged the country of Telephus son of Heracles and Auge and now King of Mysia. When he repelled the Greeks Dionysus caused him to stumble over a vine and he was wounded by Achilles. Told by an oracle that his wound could be cured only by him who had inflicted it he visited the Greeks who likewise knew through an oracle that they could not take

Troy without the aid of Telephus. Achilles there fore gladly cured him with rust from the spear which had injured him and Telephus showed the Greeks the route they should take

300 Assembled a second time at Aulis the Greeks were delayed by unfavourable winds for Agamemnon by killing a hart had vexed Artemis. Calchas foretold that only the sacrifice of Agamemnon's daughter Iphigenia would appease the goddess and Agamemnon reluctantly gave his consent though some say that Artemis snatched Iphigenia from the altar and bore her off to Tauris (see para 390). Certainly the winds changed and the fleet set sail

301 When they landed on the island of Tenedos in sight of Troy Achilles killed King Tennes and his father Cynus and here Philoctetes son of Poeas suffered misfortune. Most famous of the Greek archers he had been the friend of Heracles and had received from him the famous bow and poisoned arrows when he set fire to the hero's funeral pyre on Mt Oeta. He was now injured in the foot by one of these arrows or as some say by the bite of a snake and the smell of the wound became so offensive that on the advice of Odysseus Philoctetes was left behind on the island of Lemnos

302 It was probably from Tenedos that the envoys Menelaus Odysseus and Palamedes were sent to Priam to request the return of Helen. They were courteously entertained by Antenor the wisest of the Trojans who advised that Helen should be sent back but the Trojans were obdurate

303 The Greeks then attacked the mainland and Protesilaus of Thessaly who was an uncle of Philoctetes was the first to leap ashore though he knew through an oracle that it meant death. Wordsworth in his poem *Laodamia* tells how Laodamia his wife the daughter of Acastus desolate with grief begged the gods to let her husband return for only three hours. Hermes led Protesilaus to her and when he died the second time she died with him

304 Achilles the second to land on Trojan soil soon distinguished himself as the most courageous and formidable of all the Greeks

305 It was through Achilles that Aeneas entered the war. At first he took no part although he was the son of Priam's cousin Anchises. But when Achilles raided his herds on Mt Ida he led his Dadamians against the Greeks and distinguished himself in battle. His mother Aphrodite frequently helped him and once carried him away when wounded by Diomedes while the god Poseidon though hostile to Troy saved him from Achilles

306 Many cities allied to Troy were raided by Achilles. In Thebes in Chicia he killed King Eteion father of Hector's wife Andromache while Great Ajax raided the Thracian Chersonesus and in Teuthrania killed the King Teuthras and took his daughter Tecmessa

307 In the tenth year of the war the Greeks at last concentrated their armies before Troy itself which was defended by the mighty Hector by Aeneas and by many allies including Sarpedon a son of Zeus who was in command of the Lycians

308 The Greeks were hampered by rivalries between the chiefs. Odysseus took a cruel revenge on Palamedes who had tricked him into joining the forces. He bribed one of Palamedes' servants to hide under his master's bed a letter written in the name of Priam and then accused Palamedes of treachery. Palamedes' tent was searched the letter was found and he was stoned to death by the whole army. Thus perished the sage who was said to have invented lighthouses, scales measures the discus certain letters of the alphabet and dice

309 Then in the tenth year there broke out the notorious quarrel between Achilles and Agamem

non with which the *Iliad* opens Chryseis the daughter of the Trojan priest Chryseus had been taken prisoner and assigned to Agamemnon and when Chryseis came to ransom her Agamemnon roughly repulsed him. Apollo in revenge sent a plague among the Greeks and on Calchas advice Agamemnon unwillingly sent Chryseis back. He recompensed himself however by seizing Briseis who had been given to Achilles and Achilles then stubbornly refused to take any further part in the fighting though some say that his motive in this was to curry favour with Priam for he had fallen deeply in love with Priam's daughter Polyxena.

310 The Trojans quickly seized this opportunity to attack, and Agamemnon was glad to grant a truce so that Paris and Menelaus might settle the quarrel by a duel. But when Paris was losing Aphrodite carried him away and fighting broke out again.

311 Diomedes wounded Aeneas and Aphrodite and then strove with Glaucus a Lycian prince second in command to Sarpedon but when they remembered the friendship between their forefathers they desisted and exchanged gifts. Hector and Ajax fought in single combat till nightfall when they also exchanged gifts Hector giving Ajax a sword and receiving a purple baldric.

312 The Greeks hard pushed were now forced to build a wall and trench and when they were driven back even farther Agamemnon in alarm offered to return Briseis to Achilles but he courteously and firmly refused.

313 Diomedes and Odysseus then made a night raid on the Trojan lines. After killing the spy Dolon they slew Rhesus the Thracian and drove off his snow white horses for an oracle had declared that once they had drunk of Scamander and eaten the grass of the Trojan plain the city would not be taken. The play *Rhesus* attributed to Euripides dramatises these incidents from the *Iliad*.

314 Next day however the Trojans victoriously set fire to the very ships and Achilles went so far as to lend Patroclus his own armour and let him lead the Myrmidones. After killing Sarpedon Patroclus drove the Trojans back to their very walls until he was at last himself wounded by Euphorbus son of Panthous and slain by Hector who at once stripped him of his borrowed armour though Menelaus who had killed Euphorbus now joined with Ajax in rescuing the body.

315 Achilles was prostrate with grief but Thetis visited him with new armour made by Hephaestus and he made peace with Agamemnon who at last sent Briseis back. Achilles then drove the terrified Trojans back to the city. The noble Hector alone withstood him though Priam and Hecuba implored him to come in. Thrice did Achilles chase Hector round the walls of Troy and then finally killed him stripped him of his armour and tying him by the ankles to his chariot dragged him ignominiously back to the ship though some say that Achilles dragged Hector three times round the walls of Troy by the purple baldric that Great Ajax had given him.

316 Each day at dawn Achilles crazed with grief pulled the corpse three times round the tomb of Patroclus until at last in one of the most touching scenes of the *Iliad* Priam, led by Hermes went to Achilles' tent and begged to ransom his son's body for burial.

317 The lovely Penthesilea now came to the Trojans aid. She was the daughter of Otrere and Ares and Queen of the Amazons. But Achilles killed her and as he mourned over her he was ridiculed by Thersites the ugliest and most scurrilous of the Greeks and Achilles felled him with a blow. This angered Diomedes a kinsman of Thersites and he flung the body of Penthesilea into the Scamander but it was rescued and honourably buried some say by Achilles himself.

318 Memnon the black skinned handsome son of Los and Priam's half brother Tithonus and King of Ethiopia now reinforced the Trojans. He killed several Greeks including Antiochus the gallant son of Nestor who too young to sail from Iulis joined his father later.

319 Thevengeful Achilles then engaged Memnon in fierce single combat while Zeus watched their fates in the balance. Memnon was slain and at the request of Los Zeus honoured him by causing birds called Memnonides to rise from his funeral pyre and fight above it till they fell as a sacrifice. They were said to visit yearly the hero's tomb on the Hellespont.

320 Many great monuments called Memnonia were supposed by the Greeks to have been erected in Memnon's honour the most famous being the colossal statue behind the temple of Egyptian Thebes which gave forth each sunrise a sound like the breaking of a lyre string.

321 Achilles own course was now run and in a battle near the Scaean gate Paris aided by Apollo shot him through the vulnerable ankle.

322 Great Ajax then killed Claucus and he and Odysseus rescued the body of Achilles. But they quarrelled violently over the possession of the armour. Homer in the *Odyssey* says that Odysseus killed Ajax and that when he summoned the spirits of the dead Ajax held sullenly aloof. Sophocles however in his tragedy *Ajax* represents Ajax thrown into madness by defeat and slaying the sheep of the Greeks believing them to be his rivals and finally falling on the very sword that Hector had given him.

323 So many heroes dead the Greeks lost heart and Calchas said they must fetch the bow and arrows of Heracles. Odysseus and Diomedes therefore sailed to the island of Lemnos where Philoctetes had been left to languish and Sophocles in his play *Philoctetes* shows how he was persuaded to return.

324 Cured of his wound by one of the sons of Asclepius either Machaon or Podalirius Philoctetes challenged Paris to an archery contest. Mortally wounded Paris besought his former lover Erione to cure him but she refused and then in remorse at his death took her own life events described by Tennyson in his *Death of Erione*.

325 Helenus and Deiphobus now quarrelled for the possession of Helen now homesick for Sparta and when Deiphobus forcibly married her Helenus as some say fled to Mt. Ida where either he freely joined the Greeks or was captured or ensnared by Odysseus for Calchas had said that only Helenus knew the secret oracles which protected Troy. Helenus said it would fall that summer if a bone of Pelops were brought to the Greeks, if Achilles son Neoptolemus or Pyrrhus joined them, and if Athens's Palladium were stolen from the citadel.

326 Agamemnon at once sent for the shoulder blade of Pelops while Odysseus Phoenix and Diomedes went to Scyros and persuaded Lycomedes to let Neoptolemus join them. Odysseus then gave Neoptolemus his father's armour.

327 It is said that Priam now sent Antenor to Agamemnon to sue for peace but Antenor out of hatred for Deiphobus conspired with the Greek leader as to how they might secure the Palladium. They arranged that Odysseus disguised as a filthy runaway slave should gain entrance to Troy. Recognised by Helen alone he gained much useful information including the confession that she longed to return home. It was either on this occasion that he stole the Palladium or later when he was accompanied by Diomedes.

328 Odysseus is said to have devised the stratagem of the wooden horse. This was built by the cowardly Epeus son of Panopeus under the supervision of Athens and it bore an inscription

saying that it was dedicated to the goddess. Then twenty-three or more of the bravest Greeks including Neoptolemus, Odysseus, Sthenelus and Thoas of Calydon climbed into the hollow belly

329 At nightfall Agamemnon and the remaining Greeks burnt their camp and sailed to the island of Tenedos leaving behind only Sinon a cousin of Odysseus and grandson of the cunning Autolycus

330 At dawn Priam and his sons found the wooden horse on the shore and believing it to be sacred to Athene had it hauled in spite of opposition up to the citadel. Cassandra declared that warriors were within it and she was supported by Laocoön son of Antenor and priest to both Apollo and Poseidon who flung a spear at the horse's flank and caused a clatter of arms. Their warning was however neglected partly because Sinon who had let himself be taken prisoner said that the horse was the Greeks' atonement for stealing the Palladium partly because the fate which now befell Laocoön was misinterpreted

331 Laocoön had offended Apollo by marrying in spite of vows of celibacy and the god now punished him by sending two enormous serpents which crushed to death both the priest and his two sons—a disaster represented in the magnificent sculpture probably dating from the first century B.C. and now in the Vatican. Priam wrongly supposed this to be a punishment for smiting the horse and it was now welcomed with feasting and revelry

332 In the evening Helen with Deiphobus strolled round the horse and imitating in turn the voice of each man's wife she called to the heroes who stifled their replies

333 At night Agamemnon warned by a beacon lit by Sinon sailed to the shore and as Antenor gave the word the warriors within the horse leapt down to slaughter and pillage

334 Priam had been persuaded by Hecuba to take refuge with her and her daughters before an altar to Zeus but their son Polydorus was slain before their very eyes by Neoptolemus and when the old king feebly tried to attack the slayer Neoptolemus butchered him also. Odysseus and Menelaus meanwhile killed and mangled Deiphobus but Menelaus pardoned Helen and led her safely to the ships

335 Cassandra fled to the sanctuary of Athene but Little Ajax roughly dragged her away and she was claimed as booty by Agamemnon. Her sister Laodice the wife of Helicaon was mercifully swallowed up by the earth

336 Hector's widow Andromache was given to Neoptolemus and the Greeks eager to exterminate the whole family of Priam even killed her infant son Astyanax by hurling him to death from the city walls fearful lest he should one day avenge his parents

337 At the demand of Achilles' ghost Polyxena was sacrificed to him by Neoptolemus to ensure favourable winds. Some say this happened at Troy others only when the Greek fleet had reached Thrace

338 Hecuba fell to the share of Odysseus who took her to the Thracian Chersonesus and there she avenged the death of one of her sons Polydorus the youngest of Priam's sons had according to Homer been slain by Achilles but later accounts speak of another son of the same name. Just before the fall of Troy Priam had entrusted him together with much gold to Polymester King of the Thracian Chersonesus and when Troy fell Polymester murdered Polydorus for his gold and cast him into the sea. Hecuba discovered the body. She contrived to kill Polymester and his two sons and she then evaded the angry Thracians by turning herself into a bitch named Mera

339 Euripides combined this story of Hecuba's revenge with that of the sacrifice of her daughter Polyxena in his tragedy *Hecuba*

340 Few of the inhabitants of Troy escaped death or slavery. The wise Antenor his wife Theano and their children were all spared and were said to have sailed to the West Coast of the Adriatic and there to have founded Venice and Padua

341 Aeneas carried on his back his blind father Anchises through the Dardanian gate and so to safety. The Romans said that he took with him the Palladium that stolen by Odysseus being only a replica and after seven years' wandering reached Latium where he founded Lavinia and became their ancestral hero

342 Ethra the mother of Theseus who had served Helen as a slave was rescued by her grandsons Acamas and Demophon the sons of Theseus and Phaedra

THE RETURNS FROM TROY

343 Part of the ancient Epic Cycle of the Greeks was the cycle known as *The Returns* which was used both by Homer and Aeschylus. It told of the adventures of the Greeks on their way home. Most suffered misfortune

344 The fate of Agamemnon is described in para 336-338 and that of Odysseus in para 333-339

345 Menelaus who failed to sacrifice to Athene took eight years and only by seizing Proteus learned how to reach Sparta where he married Hermione to Neoptolemus

346 Neoptolemus had been accompanied by Andromache and by Helenus who prophesied a safe route. He had abandoned his kingdom in Thessaly and settled in Epirus part of which he gave to Helenus who married Andromache. Neoptolemus then claimed Hermione although her grandfather Tyndareus had betrothed her to Orestes and as a result he was murdered either by Orestes himself or at his instigation

347 Many Greeks settled in Italy. Diomedes hated by Aphrodite finding on his return to Argos that his wife had been unfaithful left for Aetholia to help his grandfather Ceneus and later settled in Daunia in Italy where he married Euppe daughter of King Daunus. He was buried in one of the islands since called Diomedean and his companions were turned into gentle birds. Philoctetes also settled in Italy

348 Idomeneus caught by tempest on his return to Crete vowed to sacrifice to Poseidon the first person he met on return. As this was his own son Crete was punished by pestilence and Idomeneus exiled. He settled in Calabria in Italy

349 Demophon son of Theseus visited Thrace and gained the love of the king's daughter Phylis but when he left her to visit Athens she killed herself in despair of his return and was turned into a tree

350 Many sailors were shipwrecked on the dangerous promontory of Caphtoreus where Nauplius King of Euboea eager to avenge the death of his son Palamedes lighted misleading fires

351 The seer Calchas like Amphilochous went safely overland to Colophon. Here he contended in prophecy with Mopsus a son of Apollo and Manto the daughter of Teiresias and being surpassed he died of grief. Amphilochous joined with Mopsus in founding the city of Mallus but they killed each other in a fight for its possession

352 Nestor alone returned home without mishap and enjoyed a happy old age

THE WANDERINGS OF ODYSSEUS

353-359

353 Odysseus journey home lasting ten years and his final arrival in Ithaca are the theme of Homer's epic the *Odyssey*. E. V. Rieu says that this may be thought of as a novel and Samuel Butler argued that it might well have been written by a woman! The incidents of the *Odyssey* form the background of reference to the *Ulysses* of James Joyce.

354 After leaving Troy Odysseus and his men visited the Cicones where he obtained several jars of sweet wine and then they landed on the Libyan promontory of the Lotophagi. Here lived the Lotus eaters who gave his men some of the fruit inducing the enervating dreaminess described by Tennyson in *The Lotus eaters*.

355 Next landing on the west coast of Sicily Odysseus with twelve companions entered the cave of a giant but when the owner the one-eyed Cyclops Polyphemus son of Poseidon came in with his flocks he blocked the entrance with a granite stone and devoured two of Odysseus' companions. Next evening by which time only six of his men survived Odysseus made Polyphemus drunk with his sweet wine and then blinded him. At dawn the Greeks escaped by clinging under the bodies of the sheep as they went out to graze and so reached their ship but henceforth they had to reckon with the vengeful hostility of Poseidon.

356 Odysseus was next entertained by Æolus who gave him a bag of winds but when his foolish crew untied this they were blown back to Æolus who now refused further help.

357 In Telepylos city of Lamus King of the cannibal Læstrygonæes Odysseus lost all his ships except one but in this he reached Ææa the island of the enchantress Circe daughter of Helios and Perse. Men sent by Odysseus to explore were turned by her to swine and only Eurylochus returned to tell the news. Odysseus hastening to their rescue was given by Hermes the plant Moly which vanquished Circe's charms. She restored his companions and lavishly entertained them all for a year.

358 Then on Circe's advice Odysseus sought the counsel of the dead seer Teiresias. He sailed to the River Oceanus and in the land of the Cimmerians summoned the spirits of the dead who thronged to lap the blood of a libation he had prepared. First appeared Elenor one of his crew who while drunk had fallen to death from Circe's roof. Later came Teiresias who gave him prophetic advice and then Anticleia the mother of Odysseus the men and women of antiquity and his former comrades.

359 He again visited Circe who advised him how to circumvent the Sirens and Scylla and Charybdis. Odysseus nullified the Sirens' spell by having himself lashed to the mast and by filling the sailors' ears with wax and he just avoided the whirlpool Charybdis though Scylla's six mouths snatched and devoured as many of his seamen.

360 At the island of Thrinacia against the warnings both of Teiresias and Circe Odysseus' companions slaughtered the cattle of Helios and when they put to sea Zeus destroyed all save Odysseus himself.

361 Clinging to wreckage he drifted ten days until he reached the island of Ogygia. Here the nymph Calypso lovingly kept him for eight years, until at Athens's request Zeus sent Hermes to command his release.

362 On a raft that Calypso had taught him to make Odysseus sailed for eighteen days till it was wrecked by vengeful Poseidon. Then helped by Leucothea and Athene Odysseus landed on the island of Scheria. Here he was led by the beautiful Nausicaa to the Court of her father

Alcinous who was the prosperous ruler of the Phæacians. Alcinous gave Odysseus a ship and after an absence of ten years he at last landed on Ithaca. Athene disguised him as a beggar and he was hospitably welcomed by his swineherd Eumeus.

363 Odysseus' mother Anticleia had died of grief. Læertes his father had withdrawn to the country and his wife Penelope had been keeping at bay a crowd of unruly suitors led by Antinous. She had promised to wed one of them when she had finished a robe for Læertes but each night she unpicked the work of the day until her servants betrayed her ruse and she was now hard pressed. Her son Telemachus had gone in search of Odysseus and after visiting Nestor and Menelaus he now returned to Ithaca and also visited the hut of Eumeus.

364 Here Odysseus made himself known to Telemachus and they planned revenge. First the son set out for home followed later by Odysseus still in beggar's disguise. He was recognised only by his aged hound Argus which at once expired and by his nurse Euryclæa.

365 Next day Penelope announced that she would accept the suitor who could shoot with the great bow of Eurytus which only Odysseus had been able to wield. No one could bend it till Odysseus seized it and shot Antinous. Supported by Telemachus he killed the suitors and at last made himself known to Penelope. He then visited Læertes, but the kinsmen of the suitors rose against him and battle ensued until Athene disguised as Mentor effected a reconciliation.

366 At this point the *Odyssey* ends though Teiresias had prophesied that Odysseus must again set out on a journey and propitiate Poseidon and then return to an honourable old age till death came to him from the sea.

367 Tennyson in his poem *Ulysses* imagines him even in age hungry still for travel.

368 Another tradition says that Telegonus son of Odysseus by Circe while searching for his father landed on Ithaca and began to plunder for food. When opposed by Odysseus and Telemachus all unknowing he killed his father. He then took Telemachus and Penelope back to Ææa and there married Penelope while Telemachus married Circe.

369 Although Homer represents Penelope as a faithful wife other writers say that she became the mother of Pan either by Hermes or by all the suitors. It is a tradition such as this that Joyce evidently follows in his *Ulysses*.

LEGENDS OF THE HOUSE OF PELOPS,
370-398

370 Some of the most dramatic of all Greek stories have their setting in Mycenæ city of the legendary hero Agamemnon. In 1876 Schliemann began excavation on this ancient site and here he unearthed the famous shaft graves with their precious treasures which probably date from 1800 B.C. four centuries before the era of Agamemnon and the siege of Troy. Schliemann thus proved to the learned world that the city at all events was historical and scholars now believe that it was the centre of a Late Bronze Age culture.

371 According to legend Agamemnon was a descendant of Tantalus son of Zeus and the nymph Pluto and father of Pelops. Broetas and Niobe Tantalus was said to be a wealthy king but whether of Lydia, Argos or Corinth is uncertain.

372 Highly favoured by his father Zeus Tantalus was even invited to Olympian banquets but he proved unworthy of such honours divulging Zeus' secrets and stealing nectar and ambrosia from Olympus.

373 Tantulus was also said to have received from Pandareus a dog made of gold and then to have sworn by Zeus that he had never seen or heard of it. As this dog was the one which Hephæstus had made for Iphæa and which she had set to watch the cradle of the infant Zeus the gods were naturally incensed. Pandareus perished miserably and his orphan daughters were carried off by Harpies and Tantulus suffered agonising punishment for this and other crimes the most ghastly of which was his murder of his son Pelops. Having invited the gods to a banquet he cut Pelops into pieces and served them in a stew. Demeter still grieving for Persephone was the only divinity who did not notice what she was eating and she consumed the shoulder.

374 Tantulus punishment became proverbial. Tortured with thirst he was placed in a lake whose waters receded whenever he attempted to drink while above his head were laden fruit boughs which flew upwards as soon as he reached for them. Thus tantalised he also saw suspended above his head a huge rock which threatened to fall and crush him.

375 After punishing Tantulus Zeus ordered Hermes to put the limbs of Pelops into a cauldron and boil them. Clotho took him from the cauldron. Demeter gave him an ivory shoulder which became a kind of birthmark for his descendants and Pelops was restored to life.

376 Pelops was later expelled from his kingdom of Phrygia and came with his followers to Pisa in this Here Enomaus son of Arus was king and as an oracle had said that he would be killed by his son in law he challenged to a chariot race all who came to woo his daughter Hippodameia. If the young man won he would marry Hippodameia; if not he would be killed by the spear of Enomaus which like his wind begotten horses was a gift of his father Arus.

377 Many suitors had lost their lives when Pelops arrived in Pisa. He was already possessed of a winged golden chariot the gift of Posidon but he also bribed Enomaus' charioteer Myrtilus the son of Hermes with the promise of half the kingdom to remove the iron pin from the chariot of his master and substitute one of wax. Enomaus was flung out and killed and Pelops married Hippodameia.

378 Pelops refused to keep faith with Myrtilus and flung him into the sea. Myrtilus as he died cursed the whole race of Pelops and his image was set among the stars as the charioteer by his father Hermes. Pelops soon became master of Olympia and revived the Olympic Games. His wealth and power in the peninsula were so great that it was called the Peloponnesus or Island of Pelops.

379 The eldest sons of Pelops Atreus and Thyestes with the connivance of their mother killed Chrysippus their half brother and were obliged to flee their home.

380 They were kindly received at Mycenæ and after the death of King Eurystheus Atreus seized the kingdom in spite of the bitter rivalry of Thyestes whom he forthwith banished.

381 Thyestes however who had already succeeded in seducing Atreus' second wife Ærope now tricked his brother into killing Pleisthenes his own son by his first wife. Atreus planning grisly reprisals lured Thyestes to Mycenæ by promising him half the kingdom. He then killed the sons of Thyestes and served him their flesh at a banquet. When the horror-stricken father realised what he had eaten he laid a curse on the house of Atreus and fled once more.

382 Thyestes seeking revenge was advised by the Delphic Oracle to begot a son by his own daughter and going to King Thespotus at Sicyon where his daughter Pelopia was a priestess he ravished her and fled.

383 Atreus now visited Sicyon and believing Pelopia to be a daughter of Thespotus married

her as his third wife. When she gave birth to Thyestes son Ægisthus she exposed the baby but Atreus believing Ægisthus to be his own child took him in and reared him.

384 When later Thyestes was seized and brought back to Mycenæ Atreus commanded Ægisthus to slay him but Thyestes disarmed the boy and reconciling him as his own son ordered him to kill Atreus. Then at last Thyestes ruled in Mycenæ.

385 According to Homer Atreus had two sons by Ærope Agamemnon and Menelaus and these two now took refuge with King Tyndareus of Sparta. Here Menelaus married Helen daughter by Zeus of Tyndareus' wife Leda and some say that Agamemnon was helped by Tyndareus to expel Thyestes and gain his father's throne.

386 Agamemnon's wife was Clytemnestra (the daughter of Tyndareus and Leda) whom he forcibly married after killing her first husband in battle. But when his brother's wife Helen was stolen away by Paris and the Trojan War broke out Agamemnon was away fighting for ten years and it was not difficult then for Ægisthus to seduce Clytemnestra.

387 Not only had Agamemnon forcibly married Clytemnestra but he had also agreed to the sacrifice of their daughter Iphigenia at Aulis and her cup of bitterness was full when she learned that he was returning from Troy bringing with him Priam's daughter the prophetess Cassandra as his mistress.

388 It is at this point that Æschylus' great trilogy of the *Orestes* begins. Clytemnestra conspired with Ægisthus to kill both Agamemnon and Cassandra. She welcomed her husband royally on his return but while he was in his bath she tangled him in a net and after Ægisthus had twice struck him she beheaded him with an axe. She then went out to kill Cassandra who had refused to enter the palace because in visionary trance she was horrified to smell the ancient shedding of blood and the curse of Thyestes (see para 381).

389 It was not difficult now for Clytemnestra to seize power for Orestes her young son had been smuggled out of Mycenæ by his sister Electra and for many years Clytemnestra and her paramour ruled in Mycenæ.

390 Ægisthus however lived in constant fear of vengeance. He would have killed Electra had Clytemnestra allowed so he married her to a peasant who was fearful of consummating their union. Orestes meanwhile had taken refuge with Strophius King of Phocis who had married Agamemnon's sister and here he formed that friendship with the king's son Pylades which became proverbial.

391 The intensely dramatic situation at this point has inspired all three of the great Greek tragedians and it is most interesting to compare the various interpretations given by Æschylus in *The Libation Bearers* the second play of his trilogy; by Sophocles in *Electra* and by Euripides in *Electra*.

392 Electra burning for revenge sent constant messages to Orestes and when he and Pylades were of age they came secretly to Mycenæ and with Electra's help killed both Ægisthus and Clytemnestra.

393 The agonising punishment that Orestes now endured is portrayed in the *Eumenides* the last play of Æschylus' trilogy and in the *Orestes* of Euripides. Although the Delphic Oracle had encouraged Orestes to avenge his father she was powerless to prevent his being pursued by the Erinyes the avengers of matricide who drove him mad and hounded him from land to land. At length on the further advice of the Pythian Priestess he reached Athens and embraced the image of Athene in her temple on the Acropolis. The goddess then summoned the Areopagus to

judge his case. Apollo defended him again the Erinyes on the grounds that motherhood is less important than fatherhood and he was acquitted by the cast-vote of Athena the verdict being a triumph for the patriarchal principle

394 The furious Erinyes were then pacified by Athena who persuaded them to accept a grotto in Athens where they would be offered sacrifices of fawns and first fruits. Their name hence forward was Eumenides or the well meaning

395 According to another tradition followed by Euripides in his *Iphigenia among the Taurians* Orestes was told by Apollo that he would be freed from madness by fetching the statue of Artemis from the Tauric Chersonese

396 When Orestes and Pylades reached Tauris they were seized by the barbarous natives who sacrificed all strangers to Artemis but they found to their amazement that the priestess was none other than Orestes' own sister Iphigenia. Orestes believed that she had lost her life when sacrificed to Artemis at Aulis (as is described in para 300) but she had in fact been rescued by the goddess and brought to Tauris as her priestess

397 Iphigenia by her ready wit rescued Orestes and Pylades from sacrifice and all three returned to Greece carrying with them the image of the goddess. Here they were reunited with Ilectra and returned to Mycenae where Orestes by killing Clytaemnestra son and becoming king finally ended the strife between the sons of Atreus

398 Orestes after killing his rival Neoptolemus married his cousin Hermione and Ilectra was married to Pylades

THE UNDERWORLD, 399-409

399 The Greeks expected to enter after death into the cheerless nether world the domain of Hades known to the Romans as Orcus or Dis but as Hades was possessor of all the rich metals and gems of the earth the ancients usually preferred the euphemism Pluto the wealth when speaking of one so dreaded

400 The word Hades was used too of his actual domain which was also called Tartarus although in the *Iliad* the word Tartarus had been reserved for the very lowest region of the Underworld where the rebel Titans had been thrust

401 Hades son of Cronus and Rhea won the lordship of the nether world when his brother Zeus won the sky and Poseidon the sea. His most treasured possessions were the helmet of darkness given him by the Cyclopes and the staff with which he drove the ghosts

402 He ruled with his queen Persephone whom he had forcibly abducted from the upper

world but he was not always faithful to her and she once chased the nymph Minthe whom he was pursuing into the plant nymet and the nymph Leuce whom he loved was afterwards changed into the white poplar

403 The companion to Persephone was Hecate who had once aided Demeter in her search for the lost maiden. Hecate was a mysterious divinity a triple goddess mighty in heaven on earth and in the Underworld honoured by Zeus and all the immortal gods. She came to be regarded by the Hellenes as primarily a dread divinity of the Underworld as one who kept company with the dead and who fostered sorcery and witchcraft. The figures as such in *Vacche* worshipped where three roads met she was represented with three bodies and three heads

404 Also dwelling in the Underworld were the Erinyes winged daughters of earth or of night with serpent hair who punished unnatural crime. They were later known euphemistically as the Eumenides or well meaning and this name was said to have been given them after the acquittal of Orestes as is portrayed in the *Eumenides* of Aeschylus. Late writers named three Erinyes: Megaera and Mephone

405 Ghosts conducted to Hades realm by Hermes had first to cross the Styx the hated river and supplied by relatives with a coin laid under the tongue of the corpse they paid the surly ferryman Charon. Without this coin they were unable to cross the Styx. Arrived on the farther bank they promitted Cerberus represented by later writers as a fierce dog with three heads said to be another of the monsters born to Echidne

406 Styx was not the only river ghosts encountered. There was also Acheron river of woe Phlegethon river of flames Cocytus river of wailing and Lethe the river of forgetfulness where ghosts drank and forgot their past

407 The three judges of the Underworld were Aeacus Phadamanthus and Minos. Wicked spirits were sent by them to the place of punishment those who had led an indifferent life to the cheerless asphodel fields and the virtuous to Elysium

408 Although Elysium was said to be near the Underworld it formed no part of Hades' dominion and Homer placed it far away to the west of the earth near Oceanus. It was a blessed abode without cold or snow. Later writers also spoke of the Fortunate Isles located by Greek geographers as beyond the pillars of Heracles and eventually identified with the Canary and Madeira islands

409 In their picture of life after death the Greeks combined contradictory ideas. Broadly speaking the figures of Persephone and Hecate represent the hopes of pre-Hellenic people for an after life while Hades personifies the Hellenic fear of the finality of death.

PART III INDEX AND GLOSSARY

Note The numbers in this part refer to the numbered paragraphs in Part II

Abas (1) Son of Celeus and Metanira turned by Demeter into a lizard because he mocked her when she drank too eagerly. See also 113
(2) The grandson of Danaus and twelfth King of Argolis was renowned for his sacred shield the very sight of which subdued revolt. He was father of the twins Acrisius and Proetus

Abderus 180

Absyrtus (or Apsyrtus) 159

Abyla 182

Academus 215

Acamas a son of Theseus and Phaedra went with Diomedes to Troy to demand the surrender of Helen. See also 211, 342

Acastus was the son of Pelias King of Iolcos. He joined the Argonauts but after Medea had caused the death of Pelias Acastus banished her and Jason. He later received Pelus kindly but when he falsely suspected his guest of making love to his wife he treacherously deserted him. Acastus and his wife were later slain by Peleus. The daughter of Acastus was Laodamia

Aetæon 83
Admete 181
Admetus King of Phærae in Thessaly was helped by Apollo to marry Alceste the beautiful daughter of Pelias. Apollo also ensured that Admetus should escape death provided that one of his family would die in his place (*see* 73). When the time came and Hermes summoned Admetus to Tartarus only Alceste was willing to die in his stead but when she descended to Tartarus Persephone refused the sacrifice. A later version says that Heracles arrived with an olive club just in time to prevent Hades who had arrived in person from carrying off Alceste. The earlier version represents a matriarchal point of view. The later was dramatised by Euripides in his *Alceste* translated by Brown *ing*
Adonis 62
Adrastus 261 262 263 265 267 268 270
Æadides descendants of Æacus
Æacus son of Zeus and Ægina was King of the Myrmidones. He helped Poseidon and Apollo to build the walls of Troy. By his wife Endeus he had two sons Peleus and Telamon while Phocus was his son by a Nereid. So virtuous was the life of Æacus that he became one of the three judges of the Underworld. *See also* 407
Ææa 357 368
Ædon was the daughter of Pandæus and wife of Zethus King of Thebes. Her son was Itylus. Ædon was jealous of Niobe the wife of Zethus brother Amphion and in an attempt to kill Niobe a eldest son she killed her own son Itylus in mistake. Zeus in pity turned her into a nightingale whose song still mourns for Itylus

(3) The builder of Argo 155

Aria the mother of Miletus by Apollo

Aradne 231 235

Arion (1) An actual historical character was a lyric poet and player on the lyre who lived at the Court of Periander of Corinth at about 625 B.C. The following curious fable is told of him. On one occasion Arion visited Sicily and won the prize in a musical contest. Laden with gifts he took ship for Corinth and the captain and crew decided to murder him for his treasure. They gave him permission to sing one last song. Arion then invoked the gods and leapt into the sea. Here he was rescued by one of the muses, loving dolphins that had gathered to hear his song and taken on its back to Corinth where he told Periander of his adventures. Later when the ship arrived the captain and crew swore that Arion had been detained in Sicily. Periander then confronted them with Arion himself and had them executed. The images of Arion and his lyre were set among the stars.
(2) A fabulous horse 108

Aristaeus was the son of Apollo and Cyrene, born in Libya. He went to Thrace and fell in love with Larydce who fleeing from him perished by a snake bite. As a punishment Aristaeus lost his bees and how he raised a new swarm is told in Virgil's fourth *Georgics*. After death was worshipped as a god

Ascalaphus 112 184

Asclepius or **Æsculapius** was a son of Apollo by Coronis. He was brought up by Cheiron who taught him healing. He once recalled a dead man to life and was killed by Zeus with a thunderbolt. At Apollo's request, however, he was placed among the stars. Another tradition says that Asclepius was a native of Epidaurus. In Homer he was not a god but the blameless physician father of Machaon and Podalirius, physicians to the Greek Army. His supposed descendants were the Asclepiads, a caste of priests who transmitted from father to son the knowledge of medicine as a sacred secret. Epidaurus was the centre of Asclepius worship. Cocks were sacrificed to him and serpents sacred.

Asopus a river god son of Oceanus and Tethys, and father of Lyadne, Euboea and Ægina

Astarte 57

Astræus a Titan was father by Eos of the beneficent winds and some say of the stars also

Astyanax 336

Atalanta (1) The Arcadian Atalanta daughter of Iasus and Clymene was exposed by her father and suckled by a bear. She always carried arms. She joined the Calydonian hunt and bore a son, Parthenopæus, to Meleager. Reconciled to her father she refused to marry

unless a suitor should conquer her in a foot race those who failed in the attempt being killed by her. Eventually Milanor outstripped Atalanta by dropping in her way one after the other three golden apples given him by Aphrodite. Atalanta stopped to gather these and lost the race. See also 263.

(2) The Boeotian Atalanta was said to be daughter of Schœneus and to have married Hippomenes but the same tales are told of her. See Swinburne's play *Atalanta in Calydon* and the poem *Atalanta's Race* by William Morris.

Athamas was the son of Æolus and King of Orchomenus in Boeotia. At Hera's command he married Nephele and had children Phrixus and Helle. But Athamas secretly loved Ino, daughter of Cadmus and Harmonia who bore him Learchus and Melicertes. Deceived by Ino's intrigues Athamas would have sacrificed Phrixus had not a ram with a golden fleece sent by Hermes rescued the boy and flown through the air with him and his sister Helle. Between Europe and Asia Helle fell into the straits since called Hellespont but Phrixus reached Colchis where he sacrificed the ram to Zeus and gave the fleece to Jætes from whom it was later carried off by Jason. Meanwhile Athamas driven mad by Hera because he had sheltered Dionysus killed his son Learchus and Ino flung herself into the sea with Melicertes where both were transformed into marine deities. Ino became Leucothea and Melicertes changed to Palamon. Athamas forced to flee settled in Thessaly. See also 120.

Dioscuri were the twin heroes Castor and Polydeuces (called by the Romans Pollux) According to Homer they were sons of Leda and King Tyndareus of Sparta but some said that they were like Helen children of Leda and Zeus and that all three were born at the same time out of an egg Another tradition held that only Helen and Polydeuces were children of Zeus and that Castor was son of Tyndareus and therefore mortal Polydeuces famous as a boxer and Castor as tamer of horses were inseparable They were noted for their rescue of Helen from Aphidna (*see* 215) for their part in the Calydonian hunt and the expedition of the Argonauts (*see* 155 157) and for their final battle with another pair of inseparable twins their cousins and rivals Idas and Lynceus sons of Aphareus Accounts of the battle vary but it is usually said that Idas killed Castor that Polydeuces killed Lynceus and that Zeus intervened by slaying Idas with a thunderbolt Polydeuces the only survivor implored Zeus to let him die with Castor but Zeus decreed that the twins should spend their days alternately under the earth and among the gods He also set their image among the stars as Gemini The worship of the Dioscuri as divine spread from Sparta Poseidon giving them power over wind and wave they were worshipped especially as protectors of sailors They were regarded as inventors of the war dance and patrons of bards and they presided at the Spartan Games In art each is represented as mounted on a magnificent white horse carrying a spear and wearing an egg shaped helmet crowned with a star

Gaiothas daughter of Proetus of Thebes and friend of Alcmena
Ganymede the most beautiful youth alive was according to the Homeric account the son of King Tros and Callirhoë. He was carried off by the gods to be cup bearer to Zeus in place of Hebe. Later writers say that Zeus himself in love with Ganymede disguised himself as an eagle and carried him off. Zeus sent Tros as compensation a pair of horses. Other traditions do not agree as to Ganymede's parentage. The myth was very popular in Greece and Rome as it gave a religious sanction to a man's passion for a youth (see Plato's *Phaedrus* 79). *See also* 274 275

Lichas 196

Linus (1) According to the Argive story Linus was the son of the princess Psamathe by Apollo. Psamathe exposed her son who was reared by shepherds but later torn to pieces by her father's dogs. Her distress at this revealed her predicament to her father who condemned her to death. Apollo in anger visited Argos with a plague until the Argives propitiated Linus and Psamathe by dirges called *linoi*.

(2) Another tradition told of a Linus son of a Muse who was gifted in music and killed by jealous Apollo.

(3) The Thebans also told of Linus the instructor of Hercules who was killed by the hero with a lyre. See also 167.

The ancient *linoi* dirges were widespread and they have been described by Frazer in *The Golden Bough*. They are most probably lamentations for Linus as a vegetation spirit perhaps of flax.

Metis 7 25 41

Midas was the son or adopted son of Gordius King of Phrygia. He kindly entertained Silenus and when Dionysus asked him what reward he would like Midas requested that all he touched should be turned to gold. When he was unable to eat Midas begged to be freed of his golden touch and was told by the god to bathe in the source of the Pactolus near Mt. Tmolus. The sands of this river then became rich with gold.

Once when Apollo engaged in a musical contest with Pan Midas declared in favour of Pan and was cursed by revengeful Apollo with a pair of ass's ears. These he hid under a Phrygian cap so that only his barber knew of the disgrace until the barber unable any longer to keep the secret whispered it to a hole in the ground. Then a reed growing in that spot whispered the secret abroad.

Mopsus 351
Muses or *Musagetes* The Muses were divinities
 presiding over the arts and sciences. They
 were daughters of *Zeus* and *Mnemosyne* and
 were born at *Pieria* near *Mt Olympus*. Their
 worship spread from *Thracia* and *Pieria* into
Boeotia where they dwelt on *Mt Helicon* with
 its sacred fountains of *Agamippe* and *Hippo-*
crene. *Mt Parnassus* and its *Castalian Spring*
 were also sacred to them. Libations of water
 or milk and honey were offered to the Muses.
 Originally three in number they were afterwards
 spoken of as nine. *Clio* of history *Euterpe* of
 lyric poetry (or of music) *Thalia* of comedy
Melpomene of tragedy *Terpsichore* of choral
 dance and song *Erato* of erotic poetry and
 mime *Polymnia* or *Polyhymnia* of the sublime
 hymn *Calliope* of epic poetry and *Urania* of
 astronomy

Nemean Games 173
Nemesis who was said to be a daughter of
Oceanus was a goddess who originally measured
 out to men happiness and misery chastening
 those who were over fortunate. Later she
 came to be thought of as one who punished
 crime. She had a shrine at *Rhamnus* in *Attica*.
 The wheel which she habitually carried was
 probably in origin a symbol of the solar year
 according to whose seasons the sacred king was
 fated to rise to the height of his fortune or to die

"Orestes" of *Euripides* 393
Orion a son of *Poseidon* was a giant hunter and
 exceedingly handsome. He fell in love with
Merope the daughter of *Oenopion* of *Chios*.
Oenopion promised *Merope* to *Orion* if he would
 free the island of wild beasts. When he failed
 to keep his promise *Orion* seduced *Merope* and
 was blinded by *Oenopion* who was helped by
 his father *Dionysus*. An oracle told *Orion* that
 he would regain his sight if he travelled East
 and exposed his eyeballs to the rising sun. He
 went to *Lemnos* where *Hephaestus* lent him a
 guide to the East. There *Eos* fell in love with
 him and her brother *Helios* restored his sight.
Orion later joined *Artemis* as a hunter boasting
 that he would kill all the wild animals. *Apollo*
 hearing this and fearing that *Artemis* also might
 fall in love with *Orion* cunningly contrived that
 the goddess should accidentally kill him. After
 his death *Orion's* image was set among the stars
 where he appears as a man with belt and
 sworded hip. The story of his blindness cured
 in the East is a myth of the sun on whose rising
 the animals retire to their dens.
Oreithya daughter of *Erechtheus* carried away
 by *Boreas*
Orpheus, the son of King *Ægeus* and *Calliope*
 received a lyre from *Apollo* and was taught to
 play by the Muses so that he was able to
 enchant beasts trees and rocks to follow his
 music. On returning from his voyage with the
Argonauts (see 155) he married *Eurydice* and
 when she died from a snake bite he followed her

to the Underworld. Here his music delighted even Hades so that he allowed Eurydice to follow her husband back to life provided only that he did not look round. On the very threshold of life Orpheus anxiously looked back and so lost Eurydice. He was so desolate with grief that the jealous Thracian women tore him to pieces in an orgy of Dionysus, a god whom he had neglected to honour. The Muses collected the fragments of his body which were buried at the foot of Olympus but his head thrown into the River Hebrus was carried still singing down to sea and on to Lesbos whither his lyre also drifted to be placed later as a constellation in the heavens at the intercession of Apollo and the Muses.

The Greeks considered Orpheus to be the greatest poet before Homer and fragments of poetry extant were ascribed to him.

The religion Orphism was characterised by a sense of sin and the need for atonement, the idea of a suffering man god and a belief in immortality. It had an influence on such philosophers as Pythagoras and Plato and formed a link between the worship of Dionysus and Christianity.

(2) a father of fifty sons 206

(3) a name for Athens 39 40

Pan the misshapen god with goat feet horns and tail was said by some to be an ancient divinity coeval with Zeus though most reported him to be the son of Hermes. He was the god of shepherds and flocks living in rural Arcadia hunting and dancing with the nymphs. He would also lurk in forests startling travellers with a sudden shout and filling them with panic. Pan loved many nymphs including Syrinx who fled in terror and was metamorphosed into a reed from which Pan made the syrinx (or Pan's pipe) that he was said to have invented for his love of music was well known. He was also said to have seduced Selene. The Olympians looked down on Pan as a rustic uncontrolled divinity. He is the only god whose death was reported. The worship of Pan began in Arcadia which was despised by the Greeks for its backwardness. It did not reach Athens till early in the fifth century B.C. The Romans later identified Pan with Faunus. See also 14 77-97 369.

Panathenaic, 44 118 233

Pandareus 373

Pandion King of Athens was son of Erichthonius and father of Progne and Philomela and of Erechtheus who succeeded him.

Pelagians 47

Peleus son of Æacus King of Ægina joined with his brother Telamon in killing their half brother Phocus. Expelled by Æacus he went to Pithia in Thessaly where he was purified by the king's son Eurition but accompanying Eurition to hunt the Calydonian Boar he accidentally killed his benefactor. Peleus now fled to Acæstus King of Iolcos who purified him but here he was falsely accused by Acæstus' wife. Acæstus then took Peleus on a hunting expedition on Mt Pelion and while his guest was asleep secured his sword and deserted him. Peleus would have been killed by Centaurs had not Cheiron rescued him. Zeus now decided to give to Peleus the Nereid Thetis as wife. Zeus himself would have married her had he not been warned by Themis that she would bear a son more illustrious than his father. Cheiron told Peleus how to master Thetis by holding her fast whatever form she might assume and all the divinities gave. Eris came to the wedding. She in revenge cast in the golden apple which caused eventually the Trojan War. Thetis bore to Peleus the hero Achilles whose death he survived. See also 280 293 296.

Pesistratus, 44 114 118

Petasis 98

Phæaciens 362

Phædra 211

Phæthon the shining was a son of Helios by Clymene. He gained his father's permission to drive the chariot of the sun but his incontinence provoked Zeus to kill him with a thunderbolt and he fell into the River Po. His mourning sisters were turned into alder or poplar trees which wept tears of amber. Phæthon's fate may represent the ritual death of the boy interrex for the sacred king who ruled for one day and was then killed usually by horses.

During the Bronze Age amber sacred to the king was carried from Baltic to Mediterranean via the Po valley.

Phalanthus a mythical Spartan said to have founded Tarentum in Italy about 700 B.C.

Phasis river 157

- Phere was an ancient town in Thessaly the home of Admetus
- Pheres son of Cretheus and Tyro was the father of Admetus and Lycurgus and the founder of Phere in Thessaly
- Philemon an old man of Phrygia who with his wife Baucis hospitably received Zeus and Hermes

- Priapus son of Dionysus and Aphrodite a god of fruitfulness
- Procnos *see* Tereus
- Procris was the daughter of the second Erectheus to be King of Athens. She married Cephalus *See also* 229
- Procrustes or the Stretcher was the surname given to the robber Polypemon. He used to tie travellers to a bed and if they were too short he would rack them and if too tall he would hack off their legs. He was served in the same way by Theseus *See also* 205
- Proetus son of Abas King of Argolis inherited the kingdom jointly with his twin brother Acrisius. Soon expelled he fled to Iobates King of Lydia whose daughter Antea also called Sthenobea he married. Returning to Argolis he forced his brother to divide the kingdom and became ruler of Tiryns whose massive walls he built by aid of the Cyclopes *See also* Melampus Bellerophon
- Prometheus 16-20 41 176 183
- Protesilaus 303
- Proteus was the prophetic old man of the sea subject to Poseidon whose flocks of seals he tended. By assuming any shape he chose he could avoid the need of prophesying unless gripped fast when he would at last resume his usual shape and tell the truth. He could be found at midday in the island of Pharos *See also* 183 345
- Psamathe *see* Linus (1)
- Psyche appears in late Greek literature as a personification of the soul purified by suffering to enjoy true love. The beauty of the maiden Psyche excited the envy of Aphrodite who sent Eros to persecute her but he fell in love with her and secretly visited her nightly. When Psyche urged by her two sisters sought to discover his identity he left her. Searching for Eros she endured further persecution but he secretly helped her and she finally overcame Aphrodite's hatred to become immortal and united with Eros for ever. The story is told in *The Golden Ass* of Apuleius
- Pygmalion of Cyprus is said to have fallen in love with the ivory image of a maiden that he himself had made and to have prayed Aphrodite to breathe life into it. When she consented Pygmalion married the maiden whom he called Galatea. By her he became the father of Paphus and Metharme. It is probable that the story concerns a priest of Aphrodite at Paphus who kept the image of the goddess in order to retain power. *See* William Morris a version in *The Earthly Paradise*

- Teucri** 274
- Tauthras** King of Mysia married Auge He was succeeded by Telephus son of Auge by Heracles *See also* 306
- Thalia** (1) One of the nine Muses and in later times the Muse of Comedy appearing with a comic mask a shepherd's staff or a wreath of ivy
(2) One of the three Charities or Graces
- Thaeno** 340
- Thebe** 250
- Thebes** 240-271
- "Thebes Seven against" of Aeschylus 263
- Themis** 1 21 25
- "Theogony" 2
- Thersander** 269
- Thersites** 317
- Theseus** 203-218 280 267
- Thesmophoria** 114
- Thespius** 168 192
- Thessaly** 8 10 117
- Thetis** was the kindly daughter of Nereus and Doris who received in the sea depths both Hephestus and Dionysus Zeus and Poseidon both wished to marry her but Themis foretold her son would be greater than his father and she was given to Peleus She became by him the mother of Achilles *See also* 82 51 106 280 293 294 315
- Thoas** son of Andramon King of Calydon sailed with forty ships against Troy *See also* 328
- Thrace** 64 117 121 128 157
- Threspotus** 382 383
- Thrinacia** 360
- Thyestes** 379 380 381 382 383 384 385 388
- Thyia** was said to be the first woman to have sacrificed to Dionysus From her the Attic women who annually went to Parnassus to take part in Dionysus orgies were called Thyiades or Thyades The word Thyades however means 'raging women' They were the Bacchae or Bacchantes
- Thyiades** 117
- Thyone** 126
- Thyrus** 127
- Tiphussa**, Well of, 270
- Tiresias** *see* Teiresias
- Tiryns** 130 143 144 146 171
- Tisphone**, one of the Eumenides 3 404
- Titanesses**, 9
- Titanomachia**, 8
- Titans**, 1 3 4 7 8 9 11 16 17 400
- Tithonus** son of Laomedon and Strymo was half brother to Priam By the prayers of his lover Eos he was granted by Zeus immortality but as Eos had omitted to ask for perpetual youth, he shrank away till he became a cicada. *See* Tennyson's poem *Tithonus* *See also* 318
- Tityus** son of Gea (*see* 72) Tityus was sent to Tartarus Here he was pegged on the ground covering nine acres while two vultures or two snakes ate his liver
- Teopolemus** 201 288
- Tmolus**, 187
- Trachiniae** 'Women of Trachis' 197
- Trachus** 195-197
- Trapezus** 12
- Triptolemus** 113
- Triton** son of Poseidon and Amphitrite Sometimes writers spoke of Tritons in the plural and they described them as having the upper part of the body in human form the lower part that of a fish Tritons carried a trumpet made of a shell (concha) which they blew to soothe the waves
- Triton Lake** 41
- Troezen**, the birthplace of Theseus 105
- Troilus** 277 304
- Trojan War** 276 284-342
- Trophonius and Agamedes**, sons of Erginus built a temple for Apollo at Delphi As a reward they lived merrily for six days and on the seventh died in their sleep Later Trophonius had an oracle of his own at Lebadeia in Boeotia
- Tros** (1) Grandson of Dardanus 274
(2) Part of Iroy 273
- Troy** 104 272-342
- Tyche or Tuche** called by the Romans Fortuna and said to be daughter of Zeus was a goddess more popular with the Romans than the Greeks She was goddess of luck conferring or denying gifts irresponsibly She was portrayed some times juggling with a ball representing the instability of fortune sometimes with a rudder as guiding men's affairs sometimes with Amalthaea's horn or accompanied by Plutus
- Tydeus** 261 262 263 266 268
- Tyandrus** 191 285 286 340 385 386
- Typhon** 14 147 173 174 182 183 255
- Tyro** 108 152 153
- Udaeus** one of Sparta 243
- Ulysses** *see* Odysseus
- Urania**, the Muse of Astronomy appears with a staff pointing to a globe
- Uranus** 1 2 3 4 5 26 59
- Venus** a Roman goddess identified with Aphrodite 57 59 62 63
- Vesta** a Roman goddess identified with Aestia 36
- Virgil** 62
- Xanthus** 274
- Xuthus** son of Hellen married Creusa daughter of Erechtheus King of Athens Their sons were Ion and Achaëus After the death of Erechtheus Xuthus judged that Creusa's eldest brother Cecrops should be king and was expelled by his other brothers in law and settled in Achaëa Eurypides in his play *Ion* represents Ion as son to Creusa and Apollo Carried away as a baby to Delphi he is at length recognised by Creusa and adopted by Xuthus
- Zagreus** in the Cretan legend was a son of Zeus The Titans tore him to pieces and ate him alive but Athene saved his heart He was identified with Dionysus and the ceremonies of his cult were designed to promote union with the god
- Zephyrus** son of Astræus and Eos was the West wind 74
- Zetes and Calais** were winged beings the twin sons of Boreas and Oreithyia They accompanied the Argonauts and drove away the Harpies who had plagued the blind King Phineus the husband of their sister Cleopatra (*see* 167) They also freed from prison the sons of Cleopatra whom their own father Phineus had falsely suspected
- Zethus** 248 249 250
- Zeus** *see especially* 6-11 14 16 17 18 20 23-33 and *also* 36 41 43 50 52 53 60 61 65 70 71 73 83 91 92 93 100 101 103 104 105 106 111 119 120 131 150 164 165 166 198 228 224 225 244 248 251 265 274 280 285 319 334 360 361 371 372 373 375 403

THE CONTEMPORARY THEATRE

In recent years a new kind of theatre has been created under the influence of writers able to break with convention and experiment for themselves, making more imaginative use of stage and language. This section concerns the English theatre since 1950.

THE CONTEMPORARY THEATRE

This section concerns the English theatre since 1950 and is confined to plays produced before a live audience. It consists of four sections:

- I Introduction
- II Eminent Theatrical Groups
- III Glossary of Dramatic Terms
- IV Directory of Dramatists

I INTRODUCTION

What significance can the modern audience be expected to find in such spectacles as squalid garrets and basements characters most unrealistically bursting into song, old tramps changing hats, a young man trying to teach a set of weighing machines to sing the Hallelujah Chorus or three children continuously re-enacting the ritual murder of their parents?

These are some of the questions that trouble the playgoer, and since they are not always easy to answer it may be helpful first to consider what is the function of dramatic art: what are its constituents and background, and how to judge a play

The Function of Dramatic Art

It is not the function of art to make a statement but to induce an imaginative response and the spectator receives not an answer to a question but an experience.

Drama, like the other arts, gives expression to that subtle and elusive life of feeling that defies logical definition. By feeling is to be understood the whole experience of what it feels like to be alive—physical sensations, emotions, and even what it feels like to think.

This flux of sensibility cannot be netted down in logical discourse but can find expression in what Clive Bell, when discussing the visual arts, called 'significant form'.

The contemporary philosopher Susanne Langer, in her book *Feeling and Form*, has developed Clive Bell's concept, arguing that all artistic form is an indirect expression of feeling. The artist, be he painter, poet, or dramatist, creates an image a form that gives shape to his feeling, and it is for the sensitive recipient to interpret its significance.

The especial province of drama, as was pointed out by Aristotle, is to create an image, an illusion of action, that action which springs from the past but is directed towards the future and is always great with things to come. Both tragedy and comedy depict such action and the conflict which it normally entails.

The Therapeutic Effect of Drama

One of the achievements of serious drama is to create an image that will objectify and help to resolve deep human conflicts.

Most people have at some time or another come away from a fine play feeling in some inexplicable way exhilarated and released, and it has long been recognised that drama can have a beneficial, even a therapeutic effect.

It is not difficult to understand the exhilarating effect of comedy, but more difficult to understand that of tragedy. In the 4th century B.C. Aristotle claimed that tragedy accomplishes a beneficial purgation of pity and terror and very recently Miss Bradbrook has attempted a psychological explanation of the effect of serious drama on the audience. She suggests that, in watching a

matinee play, we are encouraged to sympathise with many different characters at one and the same time, and it may be that the imaginative effort entailed has a corresponding movement in the unconscious mind. Here, at the most primitive level, is an internal society, the petrified infantile images of father, mother, and siblings, to which we are linked by inflexible attitudes. It may be that the sympathetic response to the playwright's images of these figures helps us to relax our rigid attitudes towards them, so that the internal pattern of relationships shifts, and we experience a sense of release and a new access of energy.

It is noteworthy also that drama can be fully appreciated only in a public performance, a social event demanding the co-operation and understanding between author, players, and audience. Because it can flourish only in a community, normally a city, it has been called the metropolitan art.

The Constituents of Drama

Drama is a complex art in that it uses two very different kinds of ingredient: on the one hand, speech, the literary constituent; on the other, the gesture, movement, and confrontation of actors on an actual stage. Speech is man's most precise, subtle, and mature means of expression. Gesture and confrontation, which he shares to some degree with animals, is more primitive and some of the power of drama as an art form is its fusion of civilized speech and primitive gesture into one organic whole.

It is just possible to conduct brief scenes using only one of these media. The chorus in Shakespeare's *Henry V* is virtually confined to speech, and there is in Galsworthy's *Justice*, revived in 1968, a remarkable wordless scene showing a criminal in solitary confinement in his cell, that proved so moving that it is reputed to have led to an amendment of the penal code.

Perhaps the more primitive gesture has the greater emotional force, but it is the words made permanent in the literary script that up till now have constituted the commanding form of drama. Even the wordless mime is given permanence by the printed script.

The Ritual Element

While speech and the confrontation of actors are essential to full drama, there is an element that has sometimes been neglected and that is ritual, perhaps the most primitive and evocative of all. The early tragedy of Greece was probably organically connected with the religious ritual of Dionysus, and the matrix was song and dance. Similarly in England, the origins of drama are to be found in church liturgy and ritual and, on occasion, both of which used procession, paganantry, costume, and symbolic insignia to great effect and also clowning which served as comic relief to the solemnity.

There have naturally been few dramatists who have been able to combine literary ability with a sense

of stage situation and his skill in the use of ritual process. The enduring power of Shakespeare is due to his manifold genius in that he could deploy immutable poetry, swift action and such ritual enrichments as royal processions, crowning and dethroning, duelling and wrestling, masque and pageantry, song and dance.

The Background of Modern Drama

The happy fusion of both literary and theatrical excellence which is to be found in Shakespeare's plays is extremely rare for it demands not only a versatile genius but also a receptive audience and a suitable building. By the Restoration the delicate balance was already disturbed and by the middle decades of the 19th century popular taste had all but banished literature from the stage. The disorderly audiences of the time demanded only spectacular and sensational theatrical and musical effects and in the vast monopoly theatres of Drury Lane and Covent Garden they could hardly have heard let alone appreciated good dialogue. The managers discouraged men of genius so that poets like Browning who had no practical knowledge of the theatre produced wordy closet dramas which were virtually unactable while the popular theatrical melodramas like *Maria Warten* or *Murder in the Red Barn* are today unreadable.

With the gradual establishment of smaller theatres catering for a sober middle class audience men of talent again began to write on the stage. It was the turn of literature to take command and more popular and traditional techniques such as music and clowning were now banished to the music hall and pantomime.

T. W. Robertson, Henry Arthur Jones and P. G. Wodehouse all furthered the trend towards realism but it was the genius of Ibsen, especially in such works as *Ghosts* and *The Wild Duck*, that set a high standard of excellence for the literary and realistic play of middle class life. He expressed his profound insight into personal and social problems in finely constructed plays written in naturalistic prose, the overtones of poetic universality being conveyed in symbolism that was usually verbal.

Able writers like Granville Barker and Galsworthy although they lacked the poetic power of Ibsen, firmly established in England a similar type of literary play, realistic well constructed, serious-minded, concerned with the middle class and almost exclusively verbal.

Some of the few exceptions to this preoccupation with the realistic and literary are to be found in Shaw. Like Shakespeare he was not only a literary genius. He was also well acquainted with stage production and although much too wordy in old age, in his best comedies he combined some of the wittiest dialogue to be found in English drama along with the delightful shocks and surprises of total theatre. Androcles engaging Lion belongs to the same family as *Titmouse's Ass* and *Whittington's Cat*.

But Shaw in his prime was unique and between the wars the verbal realistic play was perpetuated by such writers as Maugham and Coward. Not over concerned with psychological or social issues they used it to portray the leisured classes.

By the forties the conventional West End play had with a few exceptions come to imitate not life but photography. Confined to the proscenium arch and realistic to the last trivial detail, it presented a prosaic picture of middle and upper class life with stereotyped situations, demanding only stock responses and lacking interest in ideas, poetic intensity and genuine wit. With the star cast and the long commercial run, theatre-going had become not an artistic experience but a social occasion.

Apart from the novel comedies of such writers as Upton Sinclair and Rattigan and the verse plays of T. S. Eliot and Fry, it was the revivals of the classics, English and European, that were bringing

genuine drama to the stage. Shakespeare could be enjoyed not only at Stratford-on-Avon and the Old Vic but in the West End. It was largely due to the revival of Shakespeare that the box office draw

Gielgud's fine histrionic sense and his highly sensitive and poetic interpretation had earned him that rare distinction of being the Hamlet of his generation and as early as 1904 his production and performance at the New Theatre had broken all records since Irving.

As actor and producer working with other fine artists such as Edith Evans, Peggy Ashcroft, Olivier Guinness and Scott C. Gilchrist, Gielgud confirmed his success. Enthralling interpretations of plays by Shakespeare, Webster, Otway, Congreve, Sheridan, Wilde and Chekhov demonstrated that the classics could have a wide popular appeal.

Other artists followed and in a successful season at the New Theatre, Sybil Thorndike, Olivier and Richardson played to crowded houses in *Othello*, *Henry IV*, *The Cripple* and *Peter Cyren*.

Such achievement have reminded audience and aspiring playwright that there are many other dramatic styles than that of fashionable realism and many even have helped to further the dramatic revival that began in the fifties.

The Modern Revival

Although artistic work overflows, the tidy schemes of chronology, it is helpful to distinguish two main phases of contemporary drama. Beginning with plays produced during the first sudden outburst of creativity.

The decade beginning 1905

Many new playwrights first became known during an exciting decade. There were British premises of plays by continental writers such as Brecht, Ionesco, Celine, Durrenmatt, Frisch, Vian, Hochhuth and Weiss and by the American Albee. British dramatists who soon established their reputation included Beckett, Osborne, Behan, Pinter, N. F. Simpson, Ann Jellicoe, Mortimer, Wesker, Arden, Shaffer, Saunders, and Bolt. Most of these fortunately still continue to write.

It is never easy to identify causes of artistic renewal but one reason was that young men like Wesker injected new vigour into the aged realistic mode by using it to express the vital stresses of the working people they knew. Hence the settings in shabby basements and attics (see *Neo realism*). It was in such a setting in Osborne's *Look Back in Anger* (1913) that there suddenly exploded that blast of confused and impotent anger which expressed the frustration of so many of his contemporaries.

More far reaching was the general awareness among avant garde playwrights that verbalism was not enough and their readiness to experiment with the resources of total theatre. Here the way had been shown by scholarly research into the history of the theatre which gave dramatists confidence to revive valid techniques such as song, music and clowning that the early 20th century had banished to the music hall.

The most vital stimulus was the challenge of genius. Brecht's Epic Theatre (1926) offered a more free and fluid form than that of the well made play (1913) and his novel uses of traditional theatrical devices (such as song, masks, extravagant costume and settings) direct address to the audience) were quickly adapted by dramatists like Arden, Bolt and Osborne.

Meanwhile Ionesco, wholehearted devotee of the Theatre of the Absurd (1950) introduced monsters like the rhinoceros and exploited stage properties like empty chairs to satirise man's frightened and empty existence. He was soon followed by Saunders and by Simpson whose weighing machines symbolised the dominance of

imagination by machinery. Devices recently restricted to pantomime were returning to the stage.

A pervasive and growing influence was that of Artaud's demand for a Theatre of Cruelty (qv). This is both the most novel and the most atavistic type of theatre for it attempts to recreate in modern terms that primitive even barbaric ritual from which drama evolved. It was clearly exemplified in 1964 in a play by Weiss (qv) and in England is still best known in translations.

Developments since 1965

One of the most interesting aspects of recent theatre has been a fresh and topical approach to Shakespeare.

Some critics and producers have traced in his plays the bleak disenchantment of post-war Europe. As early as 1963 Peter Brook had said that his production of *King Lear* with Paul Scofield as protagonist owed much to the Polish critic J. M. Kott whose book *Shakespeare our Contemporary* was published here in the following year.

Kott, who lived through the Nazi tyranny and the Stalinist occupation of Poland, urges that the power politics chicanery and violence of twentieth-century Europe have their counterpart in the Wars of the Roses and the Tudor disturbances. He finds in Shakespeare's Histories and in the Tragedies, especially *Macbeth*, what he terms the Grand Mechanism of history: the blood stained struggle for power with its terrible consequences and he claims that Shakespeare condemns war by showing up the feudal butchery.

The series *The Wars of the Roses*, which was produced for the BBC during 1965-6 by Peter Hall and John Barton with the Royal Shakespeare Company, vividly demonstrated the crime ridden lust for power and the feudal butchery. Meanwhile at Stratford and the Aldwych the production of *Henry V* neglected the traditional royal splendour and showed the king grimy and battle-scarred, leading a tattered army, plagued by corrupt camp followers. Played on a bare, gaunt stage, grey, metallic and cavernous, it was strikingly similar in tone and significance to Brecht's *Mother Courage*, running concurrently at the Old Vic.

Shakespearean comedy has also been approached afresh. In Clifford Williams' enchanting production for the National Theatre in 1967 of *As You Like It*, with an all-male cast, the women's parts were not being taken up in Shakespeare's time by boys with unbroken voices but by young men. Clifford Williams was aware of the unorthodox theories expressed by Kott in his *The Better Arcadia*. Kott, observing the almost identical appearance of modern youths and girls, was reminded of those Shakespearean comedies where the girl appears disguised as a youth. He argues that their theme is that of the sonnets—the impossibility of choice between the youth and the woman, the fragile boundary between friendship and love, the universality of desire which cannot be contained or limited to one sex.

Notable recent interpretations of Shakespeare have included *The Merchant of Venice* in Victorian costume with Olivier as Shylock, resembling a Rothschild financier, and Peter Brook's *A Midsummer Night's Dream*. Brilliantly original in setting, its magical effect was enhanced by the use of trapezes while the actors taking Theseus and Hippolyta also took the parts of Oberon and Titania.

Recent perspectives

Meanwhile there have since 1965 been diverse influences from abroad through plays by Soyinka, Duras, Jarry, Mrozek, Fugard, Feiffer, Lowell, Triana and Chayavsky. A new generation of British dramatists has become prominent including Mercer, Bond, McGrath, Storey, Terson, Nichols, Wood, Hampton and Stopard. Some have experimented in fresh dramatic genres and techniques but generally speaking the most novel contribution of native authors and producers has been a new candour in the presentation of social problems.

Joe Orton, whose best play had been produced in 1964, popularised a peculiar brand of black comedy (qv).

A more serious innovation was the theatre of fact. *The Investigation* of Peter Weiss set an example for plays which constitute a kind of documentary of the stage, the dramatist endeavouring to present objectively a selection and concentration of the actual events of contemporary history. But however detached the author must be by the very act of selection, betray a certain bias as indeed must the professional historian himself.

One of the most sober of such factual plays, Kipphardt's on Oppenheimer, followed Weiss in presenting a judicial enquiry, a trial scene being ripe with conflict, suspense and surprise. Hastings Lee Harvey Oswald took the same pattern. Both were shown in 1966 during a season at Hampstead, the director, Roose Evans, stressing its preoccupation with ethical problems demanding the live concern of the audience.

The RSC has also carried out an experiment in a new genre that of Directors' Theatre, and the involvement of the audience was certainly the purpose of *US*, directed by Peter Brook as a direct assault on our apathy concerning the war in Vietnam.

The avant garde Living Theatre was well represented here in 1969 by Grotowski and by Julian Beck, a dedicated and disciplined company which presented *Parade Now* and their versions of *Frankenstein* and *Antigone*. In this new genre coherent narrative sequence is discarded in favour of a series of happenings—disparate theatrical images involving movement, mime, articulate cries, rhythmic sound and music. These are frequently violent, sometimes in a talented company surprising and beautiful but often unenthralling. Living Theatre is often imbued with the spirit of Artaud's Theatre of Cruelty, stressing intense suffering to convey an anarchic message. Sometimes audience participation is invited, actors and spectators mingling with each other both on stage and in the auditorium.

A refreshing candour in the approach to social problems has been evident in plays involving biting criticism of the military mentality and recourse to war, notably McGrath's *Before Gun Vain*, *The Generals*, Tea and Charles Wood's *Dingo* and *H*.

Meanwhile the pressing international problem of relations between black and white has been illuminated in plays by Fugard, Saunders, Robert Lowell and the Negro Le Roi Jones.

Illness, both physical and mental, is now frankly presented. Peter Nichols in 1967 used remarkably theatrical skill in revealing the effects on the parents of the morable illness of a spastic child. His ironic *The National Health* (1969) was set in a grim hospital ward.

It is no longer unusual to see a play depicting the distressed mind. Storey's first play had as protagonist a young husband struggling through a nervous breakdown and his touching work *Home* (1970) is set in the grounds of a mental hospital. Both he and Mercer have been concerned with the malaise of a generation educated beyond the parents and playwrights, as dissimilar as Mortimer and Triana have presented the disturbed personality.

There has steadily developed a sympathetic attitude towards sexual deviation. In 1965 *A Patriot for Me*, Osborne's uncompromising record of a homosexual could be performed only privately while Frank Marcus' *The Killing of Sister George* indicated a lesbian relationship only under cover of some obvious comic satire of B.C. germs and their credulous public. But by 1966 Charles Dyer's *The Slavecase*, although serio comic in tone, could give a direct and uncluttered picture of a homosexual partnership, and in 1968 Christopher Hampton's *Total Eclipse* was completely

devoted to a sober searching and candid exploration of the historic relationship between Verlaine and Rimbaud

The abolition in September 1968 of the Lord Chamberlain's powers of theatre censorship removed official taboos on the dramatist's freedom of expression, which will in future be conditioned by the public's response. There has been an increasing vogue for permissiveness in the use of four letter words and in sexual reference. The revue *Oh! Calcutta!* (1970), sponsored by Tymn, included a representation of sexual intercourse and total nudity. The taboo on stage nakedness was broken.

The playgoer of today is in a curious dilemma. The avant garde dramatist relies increasingly on theatrical device to the neglect of coherent speech while in the West End there has been a reaction towards the styles fashionable just before the modern revival. The kitchen sink play of Neo realism (*etc*) is now seldom seen and a feature of 1970 has been a return to favour of the well made play with revivals of Coward, Frisley and Maugham.

For those who enjoy both literature and exciting theatrical surprise one pleasure is the continuous stream of Shaw productions which has characterised the contemporary revival. The greatest sustenance of all is of course the abundant opportunity to enter imaginatively into the world of Shakespeare the many sided genius who reconciles the opposites. Here we are especially indebted to the exquisite ensemble playing of the National Theatre and the Royal Shakespeare Company.

Criteria of Judgment

How can the value of novel and experimental plays be estimated? The ultimate test of time is obviously impossible and some of the critical principles by which traditional drama has been interpreted are no longer relevant to the revolutionary plays of Brecht and Ionesco.

The first canon of criticism is to remember that every art form determines the criteria by which it is judged and the good dramatic critic does not approach any play with a pontifical set of rules but endeavours to keep an open mind and so to discover its unique significance and value.

Since artistic form is an expression of human feeling the first encounter with a work of art should be in a mood of extreme receptivity so that by shedding preconceived notions the recipient may be aware of the feelings implicit in the work, however novel or even bizarre the expression may be. The initial reaction to drama should be intuitive.

The nature and quality of the implicit feeling can then be considered. Is it an original and genuine response to experience or perfunctory and stereotyped, is it intense or diffuse, profound or shallow, subtle or commonplace, reasoned or irrational.

Questioning its inherent feeling often reveals that a commercially successful piece although well made is valueless while an unconventional work like Pinter's *Dumb Waiter* explores and reveals deep seated anxieties and fears.

Drama is an especially complicated art in that part of its material being words it may also involve discussion of ideas. This discussion however should not be mistaken for a statement of the author's convictions. In a good play it is an expression of his characters' *feeling* about ideas very different thing.

Another enquiry concerns the appropriateness and beauty of the form in which the feeling is conveyed. Many consider that Beckett's *Waiting for Godot* conveys the same mood implicit in *Lear* and that each play is an image of man disillusioned adrift as-sailed by despair in an chaotic universe. This recognised the critic's task is to explore the form of the two plays. Apart from the fact that they both use a most unprovableable they could hardly be more different. *Lear* is a Renaissance verse tragedy of the fall of princes with subtle presentation of character development and contrast and with a coherent plot skillfully developed through arresting action up to the tragic climax. *Waiting for Godot* is a play about an abortive encounter almost devoid of individual characterisation and story with a static circular structure and an ending as ambiguous and inconclusive as its beginning. Yet in either case the form of the play has artistic significance and appropriateness and repay analysis and here again the critic needs to be a flexible interpreter of the artist's purpose.

The most searching question to be asked of a play is whether it is life enhancing whether like the finest art it gives delight or deepens understanding.

Most difficult to estimate are those plays like *Lear* or *Godot* which express a mood of despair. But if man's honesty and endurance are ultimately affirmed the play is not negative in import. *Lear* begs forgiveness and the tramps still wait. Similarly a biting satire may be positive if it helps to clear away old wood to make room for new growth. A facile optimism may be a betrayal.

Ideally the best way to know a play is first to see it on the stage when its theatrical qualities can be enjoyed and later to read it at leisure when its literary value can be appreciated.

II EMINENT THEATRICAL GROUPS

We are greatly indebted to a few enterprising and devoted groups—chiefly repertory companies and theatre clubs—which help to keep drama alive.

Foremost are the Royal Shakespeare Company and the National Theatre which have earned an international reputation by their superb productions of both classics and new plays. Some groups such as the English Stage Company and the Traverse Theatre, Edinburgh have been particularly concerned in introducing new dramatists.

Many repertory theatres are doing exciting work and a comprehensive list of these can be found in the *Slaps Year Book*.

Among commercial promoters H. M. Tennent can be relied on for the high quality of their revivals of period plays.

The Royal Shakespeare Company

When Peter Hall was appointed managing director in January 1960 his enterprising work revolutionised the RSC. He decided to supple-

ment the annual season of Shakespeare at Stratford on Avon by a continuous repertory of classical and contemporary plays at the Aldwych and in 1962 a special experimental season was also held at the Arts Theatre.

Under the directors Peter Hall, Peter Brook and Paul Scofield a brilliant team of over 100 actors was gathered together and the imaginative direction and artistic perfection of the ensemble playing became world famous.

In the spring of 1968 there was a rearrangement among the artists and executives at the head of the RSC. Peter Hall gave up his post as managing director to become director with special responsibilities for RSC films and for the design and building of the Company's new London theatre in the Barbican.

Each year at the Aldwych original Shakespearean productions from Stratford alternate with other classics and stimulating modern work. Between 1960 and 1965 there were productions of highly experimental plays by Beckett, Livings, Pinter, Saunders and Whiting and by foreign

writers such as Arrabal, Brecht, Dürrenmatt, Hochhuth, Tardieu, Vitrac and Weiss. The years 1966-7 saw new plays by Dina Mrozek, Dürrenmatt, Triana, Feiffer, Merce and Dyer and Peter Brook's much discussed *Ubu*, as well as revivals of Gogol and Ibsen. A special American season was launched in the period 1968-9 with British premières from Albee, Chavchavsky, Feiffer and Kopit.

During the 1969-70 season there were premières of plays by Pinter, Albee, Merce and Günter Grass as well as many most original interpretations of Shakespeare and a six weeks festival in 1970 at the Fountains.

The annual World Theatre Season, dating from 1964, gives a unique opportunity for seeing ensembles from other countries, special apparatus for simultaneous translation having been installed.

An excellent innovation has been the mobile theatre-ground for young people which since 1960 has worked in collaboration with educational and municipal authorities.

A thriving R.S.C. Theatre Club provides book, magazine facilities and concessions, discussions and a quarterly magazine *Flourish*.

The National Theatre

Sixty years after Granville Barker and Wilham Archer had formulated plans for a National Theatre, the inaugural production of *Hamlet* took place on 22 October 1963 at its temporary home, the Old Vic.

Laurence Olivier, already appointed director, the nucleus of distinguished company was formed and soon established its high reputation for exquisite ensemble playing, guest artists also appearing on occasion.

The intention has been to build up a large repertoire of classical and modern plays from all countries and the wide and varied list includes works by Shakespeare, Ben Jonson, Webster, Congreve, Farquhar, Pinter, Brinhouse, Shaw, O'Casey, Maugham, Shaffer, Arden, Chekhov, Ostrovsky, Feydeau, Brecht and Miller.

The inventive quality of production and acting has been enthusiastically acclaimed by packed houses and the scenery has often been breathtaking, especially in the designs of the Czech Svoboda for Ostrovsky's *The Storm* and Chekhov's *The Three Sisters*.

Recently there has been added to the repertoire a superb interpretation of Strindberg's *Dance of Death*, produced by Bryan Shaw, with Olivier as Edgar. Cezard has made his welcome debut at The National in *Tartuffe* and Seneca's *Oedipus*. Clifford's fascinating production of *As You Like It* with an all male cast has appeared and contemporary pieces have included Stoppard's *Rosencrantz and Guildenstern Are Dead*, a work of great virtuosity, Charles Wood's *H. The Advertisement* by Natalia Ginzburg and *The National Health* by Peter Nichols.

A most attractive booklet is issued for each production and is available to the audience at a trifling cost. This supplies authoritative information about the author, the play, its sources and inner references, notable productions and critical estimates, together with photographs, reproductions and plans.

Productions of the National Theatre have appeared at the Chichester Festival Theatre and have gone on provincial tours. In September 1965 the company made its first tour abroad, visiting the Foremost Soviet theatre, the Kremlin Jovelsky and the Freie Volksbühne in West Berlin.

In the autumn of 1967 there was a six week tour of Canada. During the two week continental tour of September 1968 the company played in Stockholm, Copenhagen, Belgrade and Venice.

A recent welcome development has been an experimental workshop season in the spring of 1969, when three different productions were staged during three weeks at the Jeannette Cochrane Theatre.

In 1970 a new company, the Young Vic, was formed with its own auditorium in The Cut. It caters for the under 25s and has already offered a wide choice of playwrights including Shakespeare, Beckett and Molière.

The English Stage Company

Since 1956 the English Stage Company at the Royal Court has been tireless in its discovery and support of new talent. Formed to promote contemporary drama, the company acquired in 1966 a long lease of the Royal Court with George Devine (d. 1965) as director and Tony Richardson as assistant. Declaring themselves a Writers Theatre, they were extraordinarily successful in discovering and sponsoring playwrights hitherto unknown such as Osborne, N. T. Simpson, Ann Jellicoe and John Arden and in persuading the novelist Nigel Dennis to write for the stage.

An offshoot of the Company, the English Stage Society, initiated in May 1957, the inexpensive Sunday night Productions without Decor, which brought to light such successes as Wesker's *The Kitchen* and Owen's *Progress to the Park*.

Writers beginning to make their reputation elsewhere were welcomed. Beckett's *Endgame* and Krapp's *Last Tape* had their première here. Many distinguished foreign plays were seen in Britain for the first time at the Court, including Arthur Miller's *The Crucible*, Tennessee Williams' *Orpheus Descending*, Ionesco's *The Chairs* and *Phedon*, Sartre's *Noblesse* and *Ilona*, Genet's *The Blacks* and Brecht's *The Good Person of Szechuan*, the first Brecht ever staged in London.

In October 1965 William Gaskill succeeded Devine and the autumn season 1965 saw new plays by Jellicoe, Simpson and Bond. There have since been revivals of both classic and modern works and several British premières of unusual plays including Wesker's *Golden City*, Orton's *Crimes of Passion*, Charles Wood's *Dingo* and the Nigerian Wole Soyinka's *The Lion and the Jewel*. A most interesting departure has been to stage here plays from the past hitherto ignored, such as Jarry's seminal French play of 1896 *Ubu Roi*, the Russian Babel's *Marya* of 1933 and Wedekind's *Lulu*. The establishment of D. H. Lawrence as a dramatist, culminating in the special Lawrence season of 1968, was an event in theatrical history.

Similar seasons followed of three plays each by Osborne (1968), Bond (1969) and Storey (1969-70).

Lindsay Anderson and Anthony Page have become co-directors with Gaskill and the year 1970 has been extremely fruitful with excellent revivals of the classics and five premières of plays by Howarth, Hampton, Wedekind and two by Storey transferring to the West End. Theatre Upstairs, opened in 1969, still encourages the latest and most promising experimental work.

The Mermaid Theatre

It was largely due to the efforts of Bernard Miles that in 1959 the City of London's first new theatre since Shakespeare's time was opened at Blackfriars, Commerce, industry and the general public had generously given money, the City Corporation had granted the site at a pepper corn rent and the four foot thick surviving walls of a blitzed warehouse had been used as the shell for a delightful little theatre of 490 seats.

It has an open stage, based on that of Shakespeare's day, while an excellently raked auditorium, all on one tier, like a segment of a Greek amphitheatre, ensures perfect sight lines. The most modern lighting, revolving stage and sound and film equipment are installed.

The Mermaid is now part of the City's artistic life with foyer exhibitions, films, concerts and lectures. The enterprising Moleculic Club for children uses ingenious theatrical means to demonstrate basic scientific principles.

The Mermaid has a fine varied record of productions including British premières of works by Brecht, Camus and O'Casey. There have been revivals of Shakespeare, Ford, Dekker, Beaumont and Fletcher and Shaw and of foreign plays by Ibsen, Pirandello, Henry James and Lessing.

The year 1967 was notable for an imaginatively planned cycle of four dramas by Euripides concerning the Trojan War and by the English première of the fine verse play *Benito Cereno* (qv) by the distinguished poet Robert Lowell.

In 1968 the theatre's special design was admirably used for the spectacular production of

Linka's *Hadrian the Seventh* (q.v.) and 1970 was marked by Pinter's moving production of James Joyce's long neglected *Dubliners* (q.v.)

The National Youth Theatre

Originating in Alleyn's School and the enterprise of Michael Croft the N.Y.T. fosters in young people an appreciation of theatre whether as audience or participants. Since 1969 it has performed annually in the West End. Constantly expanding it now has several companies and in its foreign tours has presented plays at the festivals in Paris and Berlin. Several members have become professional actors including John Stride and Derek Jakobi of the National Theatre. Since 1967 it has been admirably served by plays specially commissioned from Terson.

Theatre Workshop

Between 1953 and 1961 Joan Littlewood as director of Theatre Workshop at Stratford East introduced several new playwrights including Behan and Delaney, spontaneists, pseudo-

Brechtian techniques and social commitment rather than careful construction were the hall marks of her work, her masterpiece being *Oh What a Lovely War* (M). This paradoxically used a period piece brilliantly to satirise the tragic futility of the first world war.

In 1967 Littlewood directed *MacBird* and *Mr. Wilson's Diary*.

MacBird (P) by Barbara Garson is an American parody on *Macbeth* in doggerel blank verse described by Brustein as 'brutally provocative and grimly amusing' as it attacks the American Establishment under Lyndon Johnson. Unfortunately Joan Littlewood made such alterations to the text that the satirical parallel with Shakespeare was blurred.

Mr. Wilson's Diary (M) in form a jolly pre-war musical was described by its authors Ingrin and Wells as 'an affectionate lampoon on the Wilson administration'.

In 1970 she returned to Stratford East where she has produced Hill's *Forward Up Your Legs* and Wells' *The Projector* set in Wapole's age but suggesting parallels with the collapse of flats at Ponan Point.

III GLOSSARY OF DRAMATIC TERMS

Absurd Drama

The Theatre of the Absurd originating in Paris was introduced here through the plays of Beckett and translations of Ionesco, Vian and Vitrac. It has had considerable impact on Pinter, N.F. Simpson, Saunders, Stoppard and Crompton while American absurdist plays by Albee, Gelber and Kopit and by the Swiss Frisch have also been produced here.

The concept of the Absurd was first formulated by Camus to indicate the discrepancy between human reason and aspiration and an indifferent and hostile universe. But like Sartre he expressed his convictions through the traditional dramatic form.

Not every playwright of the Absurd is an existentialist and many are more concerned with an irrational human society than with the universe. What they have in common is a technique. All have discarded traditional realism and express absurdity through images that are themselves absurd including bizarre situations and objects both sad and comic such as aged parents consigned to dustbins.

There is in the Absurd an element of Surrealism and Miss Bradbrook has suggested that a better term might be Theatre of Dream for it is the unconscious dream mind that juxtaposes objects and incidents that in the waking state have no connection, such as a rhinoceros in a provincial street. Pinter seems to have an intuitive awareness of the hinterland of dream while Simpson makes a conscious manipulation of Surrealism.

Frisch has ably demonstrated that the Absurd can be an effective vehicle for satire and many absurdist writers such as Ionesco and Simpson have satirised the modern prostitution of language corrupted by salesmen and politicians and have used conversation of vapid emptiness to reveal its breakdown as a means of communication.

It is partly because of their distrust of language that they have had recourse to ludicrous objects and images thus extending the range of total theatre.

The Aristotelian Play

Brecht and Ionesco have disparagingly referred somewhat inaccurately to Aristotelianism. Strictly speaking this means the concept of tragedy which Aristotle first analysed in his *Poetics* basing it primarily on the poetic tragedies of Sophocles especially the *Oedipus Rex* (P) c. 425 B.C. The Aristotelian concept, revived since the Renaissance has obviously been much modified but certain basic principles can still be discerned.

Aristotle claims that poetry in general aims at that rational pleasure which is part of the good

life. He defines tragedy as the imitation of an action. By imitation he does not mean the description of an actual happening but of one that is possible. Hence the poetic licence whereby the dramatist may adapt historical material to his own theme.

Aristotle stresses that the action should be complete in itself and have inner coherence. Tragedy must have an intelligible beginning, a middle necessitated by the beginning and which itself necessitates the end. The story must represent one action, a complete whole with its several incidents so closely connected that the transposal or withdrawal of any one will disjunct and dislocate the whole.

The action should be of some magnitude with incidents arousing pity and fear wherewith to accomplish the purgation of such emotions. Here is Aristotle's celebrated doctrine of purgation or catharsis which has been variously interpreted some considering that something like a ceremonial purification is intended with an ethical end in view others that bodily or psychological relief from tension is meant.

Aristotle emphasised the paramount importance of action or plot, the characters being revealed in and through the action. The kind of plot recommended is one where the hero is an eminent man neither inordinately good nor bad whose misfortune is brought upon him by some error of judgment.

Here is the germ of the splendid Renaissance tragedy concerned with the fall of princes and also of the modern finely constructed play, such as Ibsen's *Ghosts*. Such a play has classical symmetry the beginning middle and end becoming in modern parlance the exposition, development and climax or denouement. It has its organic unity and inevitability. But although many writers such as Sartre still work within the classical disciplines many have discarded the traditional form.

Brecht and his followers have repudiated the whole pattern in favour of a sequence of self-contained episodes strung along a narrative thread where ironic detachment supersedes the emotional involvement and catharsis of Greek tragedy.

In this day of the common man few are concerned with the fall of princes and it is interesting to examine some of the more striking modern plays and to ask how far they stand up to the Aristotelian canon. Should a new concept of tragedy be evolved that of potentiality unfulfilled, not a fall from greatness but a failure to rise?

Black Comedy

Orton (q.v.) popularised a genre in which human suffering is presented as comic. The basic tech-

nique is the shock of violent juxtapositions both in language and incident. Death, mental illness, murder, sexual perversion suddenly excite laughter because they are conveyed in deadpan jests and genteel terms or are promptly succeeded by the bathos of farce. Like circus clowning the style has some value especially in satire but it easily stifles compassion.

The Brechtian or Epic Play

Many British dramatists have felt the pervasive influence of the Bavarian Brecht (*qv*) who developed a new kind of Epic or narrative play of debate with a loose sequence of episodic scenes linked by commentary or songs. Discarding realism Brecht attempted not to arouse the onlooker's emotions but to stimulate him to think about social issues and to take left wing action. In the event his ambiguous central situation appealed to deeper levels of experience.

There have been several instances of the ambiguous protagonist but English playwrights have tended to adopt not the political intentions but the style of the Epic genre. Ibsen has said that Shaffer in *The Royal Hunt of the Sun* has joined Bolt, Arden and John Wilmot of *The Devils* in the select group of British dramatists who have genuinely benefited from the conception of epic techniques in drama.

Theatre of Cruelty

In 1938 Antonin Artaud published *The Theatre and its Double*, a collection of essays and letters which forms the theoretic basis of the Theatre of Cruelty, his central purpose being a ritual of cruelty to exorcise fantasies.

Professor Busten has described how Artaud hated industrial civilisation believing like Freud and D. H. Lawrence that it stifled instinctual life. He claimed that the theatre as the heart of a common culture should enact a primitive ritual of cruelty, a sacrificial frenzy and exaltation. In this way it would bring to the surface and exorcise the spectator's latent anarchy, violence and eroticism serving as an outlet for repressions.

Artaud's theories have yet to be proved. Anthropology has shown that a sacrificial blood ritual was long practised by primitive tribes without diminishing man's urge to cruelty, as is poetically covered in Edith Sitwell's *Gold Coast Customs* (see MSB). A modern dramatic enactment can certainly make us aware of repressed violent impulses but does it clear them away?

As to technique Artaud envisaged a total theatre appealing to total man, primarily visual, where the all important director would deploy music, dance, plastic art, pantomime, mimicry, gesticulation, intonation, architecture, scenery and lighting to induce a state of trance. Attacking the inadequacy of a pallid conceptual language, Artaud demanded that dramatic language should have an emotional and incantatory effect.

Genet fulfils Artaud's demands and in England the specific Theatre of Cruelty has been best represented by his plays the *Varat Sade* of Weiss and Triana's *The Criminals*. Its influence can be seen also in *The Architect* and the *Emperor of Assyria* of Arrabal. But the methods of production advocated by Artaud have had a wide and pervasive influence on the movement towards total theatre.

Expressionism.

The genre flourished in Germany after the first world war where its chief exponents were Kaiser and Toller and in Czechoslovakia in the plays of Capek. O'Neill and O'Casey have also occasionally experimented with Expressionism.

Reacting from Realism with its insistence on individual psychology and the detailed representation of actual life, Kaiser, Toller and Capek sought to express rather the general aspirations and fears of humanity, especially man grappling with the advent of machinery. Their characters are symbolic types as the Nameless One, representing the mob in Toller's *Man and the Masses*. Their decor is stylised, the dialogue staccato and the brief scenes are characterised by mass movement and swift action.

Weaker's *Chips* and Woods' *Dingo* employ Expressionism but in English generally it is the techniques rather than the aims of the genre that have been adopted.

Naturalism

Naturalism in drama may be regarded as a special case of Realism and it is not easy nor perhaps always desirable to make a sharp distinction between the two.

Naturalistic drama attempts to record as faithfully as possible the actual experiences of life, however banal and to present life undistorted by the playwright's theories or too much concern for artistic form. The virtues of Naturalism are fidelity and spontaneity. Its danger is that it may keep so close to life as to lose artistic form and tension becoming the stage version of the tape recorder. See *Slice of Life Play*.

It was Zola in the 1870s who propounded the principles of Naturalism. Distrusting both the play of ideas and the well constructed play is tending to impose on life a falsifying and artificial pattern, he urged that drama should record as objectively as possible the actual course of man's life, especially the way it is conditioned by environment.

Strindberg's *Miss Julie* 1888 is an essay in Naturalism but the genre is found in its most accomplished form in the Russian theatre especially in Stanislavsky's production at the Moscow Art Theatre of the plays of Chekhov and in 1902 of Gorky's *The Lower Depths*.

Neo Realism

There is nothing new in dramatic Realism (*qv*) as such. What is novel is the realistic presentation of the shabby lodgings and streets of the underprivileged Gorky in *The Lower Depths*; was perhaps the first dramatist to reveal the wretched condition of the destitute and this play influenced O'Neill's *The Iceman Cometh*. Their production in London with a starkly realistic background had some effect on those modern plays where the kitchen sink and dustbin were as much in vogue as was formerly the fashionable drawing room.

Any worth while play has significance far beyond its milieu and modern neo realistic plays vary greatly in theme and purpose. Weaker, Delaney, Livings, Owen, Osborne, Orton, Bond, Lawler and Seymour have all used the style in differing ways.

Several of these playwrights have themselves been workers and their plays are an authentic interpretation of their own culture, once accessible to the middle class audience. The fact that their work is occasionally loose in structure may be attributable to the influence of Naturalism (*qv*) or to the author's unacademic background. The advent of this fresh and vigorous drama from a group that has seldom been articulate is one of the most encouraging aspects of modern theatre.

Realism

Writers of realistic drama such as Galsworthy attempt to create a stage illusion of actual life usually through the medium of the well constructed play. It is not always easy to distinguish between Realism and Naturalism—its extreme form—but one salient difference is that the latter tends to discard organised plot as imposing a false pattern on the flux of life.

Bolt, Cooper, Mortimer, Shaffer and Porter have all written realistic plays and since the fifties there has been a succession of competently constructed realistic plays associated with the novelists, Graham Greene, C. P. Snow and Muriel Spark.

The Satirical Play

Recent years have seen heartening revivals of plays by Shaw, triggered off by Stage Sixty's production of *Widowers Houses* with its topical relevance to Rachmanism. There followed a long succession of Shaw revivals.

Shaw has found few successors for genuine satire is a most demanding art. Subjective hostility and negative criticism are not enough.

The motive power in Ibsen and Shaw was rational indignation, a most difficult fusion of strong emotion and objective reasoning and their satire was constructive in that it implied and indicated positive values. It was also characterised by a precise aim at a specific target. Vague and wholesale denunciation diffuse a disagreeable tone which has a boomerang effect for it becomes associated not with the targets but with the playwright himself.

The graces of satire are detachment, irony and wit and it flourishes apparently in a stable society such as that of the 18th century which produced Swift and Voltaire. The European upheavals of the last half century have been unpropitious for satire and it is significant that the best plays in this genre—those of Frisch and Dürrenmatt—have come from neutral Switzerland.

The English playwright nearest to Shaw is Nigel Dennis and Giles Cooper shared his ironic detachment.

The "Slice of Life" Play

Here is an extreme kind of Naturalism where the author has been so anxious to preserve fidelity to the natural spontaneity of living that he has all but discarded form as having a cramping and distorting effect.

One of the most typical examples is Henry Chapman's *You Won't Always Be On Top* showing the disconnected minor incident and talk of men ostensibly at work on a building site. Shelagh Delaney's *The Lion in Love* is also in this vein.

IV INDIVIDUAL DRAMATISTS

This part alphabetical in arrangement includes dramatists whose work whether English or in translation has had its British premiere since 1950. Unless otherwise stated the quotation of date and actor refers to the British premiere.

Inexpensive paperback editions are referred to thus: F. Faber and Faber; M. Methuen; P. Penguin. Inexpensive acting editions can usually be obtained from French's Theatre Bookshop, 26 Southampton Street, W.C.2.

Arthur Adamov (b 1908)

Adamov first wrote plays such as *Professor Taranne* (P) which translate his own personal neuroses into images of the absurd until with the propagandist *Paolo Paoli* he adopted a Brechtian technique. His *Spring 1871* an epic panorama of the Paris Commune had its world premiere in London in 1962.

Edward Albee (b 1928)

The American Albee is a brilliant satirist, master of a hostile dialogue of barbed intellectual wit and an adept in utilising diverse styles. He was adopted by wealthy foster parents and his major plays express the claustrophobia, the introverted emotional involvements, the terrible emptiness that may lurk behind the deceptively secure facade of wealth.

His early plays include the absurdist *Who's Afraid of Virginia Woolf?* (P) and *The American Dream* (P) and the realistic *The Death of Bessie Smith*.

Who's Afraid of Virginia Woolf? 1964 P

A brilliant and scarring satire on sterility in an American campus uses a ritual movement. George and Martha, named after the Washingtons, are an unsuccessful and childless middle-aged couple. They cherish a fantasy son whom George, to spite Martha symbolically, murders during a liquor-ridden night party when they attack each other and their guests (a young couple also childless) with ferocious mental cruelty.

A Delicate Balance 1969 P

An icy surface, glasses over treacherous depths, in the well-to-do home of Tobias (Hordern) and Agnes (Peggy Ashcroft) and the play begins and ends (80th Ed.).

Verse Drama

During the 20th century several attempts have been made to revive drama in verse—the normal vehicle for the Renaissance playwright. Although the verse plays of Shakespeare and his contemporaries kept alive in excellent revivals, still rare like the Himalayas above the contemporary scene, the dramatist today who tries to use verse has not the benefit of an unbroken tradition. Yeats, T. S. Eliot and Christopher Fry all succeeded for a time in getting their verse plays on to the stage but at the moment the most successful poetic drama achieves its effect through poetic prose and the theatrical poetry of its situation and stage imagery. Dylan Thomas' *Under Milk Wood* successfully used these media. For many contemporary audiences it is Beckett, Arden and Pinter who have captured the poetry inherent in drama.

The finest verse play seen on the English stage for many years is Robert Lowell's *Bentlo Cereno*.

The Well-made Play

The term, well-made play, is most frequently used in a derogatory sense. Eric Bentley has pointed out that the well-made play is a form of classical tragedy degenerated in that although the plot is ingeniously contrived with arresting situation, intrigue and suspense, the play is mechanical and devoid of feeling. The television series *The World of Wooster* is an example.

The expression was frequently used disparagingly of the French plays of Scribe and of Sardou, ridiculed by Shaw for his 'Sardoodie dum'.

ends with her virtual monologue—phrased with the elegance of a Henry James—on how it will be if she goes mad.

Agnes holds the delicate balance of polite manners while tolerant Tobias is now ineffectual and her alcoholic sister Claire persists in her sarcastic utterance of unwelcome truths. The most galling obliquely hinted at is that Tobias is more drawn to Claire than to Agnes.

Their son long since dead and Tobias having then withdrawn from Agnes, their sole offspring is the neurotic Julia who now returns home at the breakdown of her fourth marriage.

Suddenly their oldest friends Harry and Edna arrive seeking asylum from some inexplicable terror of nothing. Bewildered but courteous the hosts accept their guests but after Julia has threatened to shoot the intruders Agnes forces Tobias to realise that they bring the plague.

Tobias unable to discard his last ideal of friendship begs them to stay while telling them this truth but they depart realising that they demand a sacrifice they themselves could not make.

Here is a microcosm of a society where love and friendship have died, humanism crumbles and little but polite diplomacy survives often a vehicle for fear and hostility. In tone it is a bitter inversion of the Apocryphal *Tobit* with its touching pictures of religious faith, family love and neighbourliness and the entertaining of Angels unawares.

The literary provenance in subject and style is Eliot's *Family Reunion* where another Harry fleeing the turcs comes to a Wishwood also dominated by a woman whose husband had loved her sister like Claire also a visionary. But in Eliot the visionary is healer not destroyer and Harry departs to follow the bright angels.

With literary subtlety Albee exposes the panic and emptiness in a society losing its confidence and sense of values.

Tiny Alice 1970

A metaphysical melodrama of great emotional tension possibly personal is at surface level like Dürrenmatt's *The Visit* (qv) a satire on materialism, with the victim sold to Mammon. It has another facet, the schema being primitive magic, the sexual initiation and ritual sacrifice of the victim. Here Albee draws on techniques of

fect who in his cannibalism sucks in the Emperor's civilisation but loses his former magical power. Again come darkness and deafening noise but this time the Architect descends taking over the Emperor's rôle.

As in *Tram* a more disciplined *The Criminals* the dramatic movement is cyclical the remorse less self destroying recurrence of obsession especially guilt ridden hate and dependence on the mother. The play has some root in anthropology and recalls Artaud's theories exposing its most grisly unconscious motivation and employing a most extensive range of theatrical devices. Garcia the producer uses brilliant lighting baroque music and even an electric fork lift truck on which to mount a crucifixion sequence and the Emperor's slow giving birth to the Architect.

Tense and exciting in its assault on the senses and sensibilities the work can yet have a shattering effect on the audience which is implicitly called on to play the exhausting role of untrained psychists unable to further any resolution. The basic subject is that of Aeschylus *The Lumen* (see H30)—narcotic pursued by guilt. But the Greek tragedy is in effect exhilarating achieving that therapeutic catharsis described by Aristotle.

Isaac Babel (1894-1941)

Between 1937 and 1957 the work of Babel the Russian Jewish short story writer was banned in Russia. He died in Siberia. *Sunset* the first of his two extant plays produced in Russia under Stanislavsky in 1928 appeared on BBC television in 1964.

Marya 1967 P

Written in 1933 but not yet professionally produced in Russia *Marya* is set in Petrograd in February 1920. It evokes a precise period in history—the flux and confusion just before the Bolsheviks consolidated their power in March 1920.

The organisation of the play is poetic the balance and interplay between two social milieus. One is the decayed elegance of the liberal intelligentsia focused in the home of Mukovinn a former General where the men are well disposed but impotent the women unchaste. The other is the squalid house where Dymshitz the Jewish merchant turned black marketeer lives with his hangers on and crooks.

As in Chekhov the characters are studied in psychological depth and the quiet naturalism of the style is sometimes startled by sudden violence as in the shootings after the rape of Ludmilla. Mukovinn's younger daughter and the link between the two households.

James Baldwin (b 1924) See also M8

Baldwin is an American Negro novelist and essayist and a champion of Civil Rights.

The Amen Corner 1965

Acted by a Negro cast including singers of spirituals the successful play gently probes the genuine and the self deluded elements in religious experience.

Samuel Beckett (b 1906) See also M9

Beckett, an Anglo Irishman who has made his home in France is both novelist and the most distinguished of the English dramatists of the Absurd. His world is drastically limited peopled chiefly by old men awaiting their death but it is the profoundly tragic world of Lear in the storm and it is conceived with the intensity and haunting power and suggestiveness of the true poet.

His work is poetic in its verbal imagery, some times as searching and macabre as that of Webster and his dramatic prose has an underlying poetic rhythm often more flexible and effective than that of Eliot's verse. In structure his plays have a poetic symbolism a latent significance, like that of the novels of James Joyce. Beckett's close friend and their striking verbal imagery has a kind of

theatrical poetry as for instance the two tramps at the foot of a bare tree in *Waiting for Godot*. It is remarkable that so literary a playwright should also have succeeded with the wordless mime play.

Beckett's chief weakness as a dramatist is that the action and visual imagery are frequently too static as in the motionless dustbins in *The Game* much less effective theatrically than Ionesco's movable chairs.

Waiting for Godot 1953 F

This tantalising and compelling tragic comedy Beckett's masterpiece originally written in French and produced in Paris in 1953 was later translated and performed in more than twenty countries.

Character and incident are pared to the bone and only a skeleton situation remains. At evening on a desolate road bare but for a single tree two wretched tramps Vladimir and Estragon nicknamed Didi and Gogo wait for a mysterious Mr Godot. As they while away the time with desultory talk and clowning a tragic farcical diversion is provided by the entry of Pozzo and Lucky bullying master and wretched slave and a boy later brings a message that Mr Godot cannot come but will arrive the next evening. After discussing whether or not they shall hang themselves from the tree the tramps decide to go away for the night but remain on the spot.

Act II presents Next day same place the only difference being that the tree has sprouted a few leaves and the basic pattern of Act I is repeated.

Although by the skilful use of music hall techniques Beckett presents his tramps in the guise of amusing clowns they are at the same time pathetically human as they waver between suicide and irrational hope. A fretful affection has kept them together over fifty years and their dispositions are complementary possibly even representing different aspects of the one personality.

Pozzo and Lucky another pair of contrasting characters are portrayed more farcically. The loud confident Pozzo drives Lucky in as if he were a beast of burden. Lucky carries in his mouth the whip with which he is beaten and humbly obeys every insolent command. He dances for Pozzo and even thinks for him. In their second appearance Pozzo is blind and Lucky dumb.

They may be considered personifications respectively of master and slave worldly materialism and higher values the physical and the intellectual body and soul or the two aspects of a sadomasochistic relationship.

The play as a whole is a most complex dramatic symbol expressing man's anxiety and suffering as to his origin and destination.

The uncertainty is symbolised by the characters' confusion as to even the physical actualities of time and place but the dominating symbol is the tramps doubt as to Godot's identity and purpose.

Such an oversimplified interpretation as to equate Godot with God is inadequate yet the play has undoubted Christian references. A tree is frequently used as an emblem of the Cross. Beckett questioned about its theme quoted a wonderful sentence in Saint Augustine: 'Do not despair one of the thieves was saved. Do not presume one of the thieves was damned.'

Beckett neither affirms nor denies Saint Augustine's statement but inverts it into a question more distressing than direct denial. Can we any longer accept the existence of divine grace and judgment? It is a question such as this that gives to the play its symbolic shape of doubt and which is cogently expressed in the theatrical image of two outcasts at the foot of a tree a tree of life which puts forth leaves a tree of death which they contemplate using as a gallows.

Yet the significance of the play is even deeper than an exploration of religious doubt its appeal wider and more contemporary. The anguished uncertainty of the 20th century is whether life has any meaning whatsoever and the play shows the suffering of man lost and anxious in an apparently meaningless universe.

Some have considered it to be written from the point of view of existentialism continuing vainly to hope for a supernatural revelation, the tramps

lack the courage to come to terms with the nothingness of our existence and the need to choose and create our own destiny.

A Jungian psychologist Iva Metman has made a similar interpretation remarking: "Godot's function seems to be to keep his dependents unconscious."

Habit is a great deadener, says Vladimir. If Beckett's play enables the audience to escape the drug of habit and to face this image of anguish and so find some relief then it may have the therapeutic value of that inner knowledge advocated by Freud and Jung.

It is not a play for those who cannot bear to suffer. When performed in San Francisco Grot the first play there for forty four years it held its audience of fourteen hundred convicts spell bound. They realised that each must find his own personal message. All knew that it spoke to those who must suffer and wait.

Endgame 1958 F

Also re-created from the French, this play again depicts a static situation. In a single claustrophobic room the selfish materialistic Hamm who keeps his senile and legless parents in dustbins is now paralysed and blind and dependent on his servant Clov who longs to leave him. But if Clov should leave both would die for Hamm owns the only store of food in a devastated and dead world. Finally Clov sees outside what may be a small boy, a potential procreator, and he prepares for departure but remains immobile.

The play like poetry can be interpreted in several ways. Since Hamm and Clov are mutually dependent it probably represents tension between complementary aspects of personality: Hamm sensation and emotion, and Clov intellect. As Clov has vision and sees the boy the situation suggests the struggle of the mystic endeavouring to escape from a deadening materialism to a vital awakening of the spirit. It may also depict a period of traumatic depression when the whole external world seems dead and unreal. The play's overall impression is that of the dissolution of the personality in death, both personal and global.

Endgame lacks the wry humour of *Waiting for Godot* and is less compelling than Ionesco's *Last Year at Marienbad* but is more potent in its latent imagery than is Ionesco's play.

Krapp's Last Tape 1958 F

In the briefest sketch Krapp a solitary decrepit unsuccessful old man listens to his own autobiographical tape recording of thirty years ago but the moment of miraculous insight it commemorates is now so meaningless to him that he switches off that section of the recording and broods on a description of his love making.

Beckett employs a most effective stage device to pose contemporary queries as to the limitations of verbal communication and the continuity of personal identity.

Happy Days 1962 F

Here again the paralysis of later life is indicated. A woman talks ceaselessly although progressively buried in a mound of earth until it reaches her neck.

Beckett's two Mimeplays without Words are in striking contrast to the plays in that all is conveyed in symbolic wordless action.

Brendan Behan (1923-64),

Behan a Dubliner uses personal experiences as substance for two unusual plays considerably improved by Joan Littlewood (q.v.). Lacking structure and depth of characterisation they are impressionistic lively and voluble and Behan's strong social convictions presented in comic terms are fully integrated.

The Quare Fellow 1956 M

The play was an effective plea for the abolition of capital punishment. Its claustrophobic scene is an Irish gaol during the twenty four hours preceding the execution at 8 a.m. of the quare fellow a brutal fraticide. The murderer is never seen and the sombre theme is presented

obliquely masked by the harsh irony of prison jests and the alternation of farcical and macabre incidents as the unnerving effects of impending death is shown on prisoners and warders. Although the play has little plot its structure was taunted by Joan Littlewood who also had to trouble the length.

The film version is a distortion.

The Hostage 1959 M

Again the basic situation is waiting for an execution. The scene is a Dublin brothel. Here Irish patriots bring young Leslie captured Cockney soldier as hostage for an Irish political prisoner in Belfast who is to be executed next morning.

There is touching pathos as a little Irish maid tries to save Leslie neither of these orphans realising what the strife is about but in a raid on the house Leslie is shot. The mood is not consistent for here the comedy is supplied by a host of irrelevant characters and the action is constantly held up by satirical comments and some mediocre backchat. This pseudo Brechtian trimming detracts from the growing sense of alarm as Leslie gradually realises his fate. But the play does succeed in making the business of war seem extremely childish.

Robert Bolt (b 1924)

Bolt has recently said: "I do like plays in which the people have ideas as well as predicaments" and he is one of the few dramatists who have scored West End successes with the play of ideas. He holds the balance of discussion so fairly that only in the outcome is it clear that he himself is committed. His earlier work represented by *The Mousetrap* (1957) with Paph Richardson was in the realistic convention but more recently he has experimented with other dramatic techniques owing something to Brecht and to the Theatre of Cruelty and of the Absurd.

The Tiger and the Horse 1960

This play takes its title from Blake's "The Tygers of wrath are wiser than the horses of instruction." It is concerned with the inadequacy of detachment, the philosophy held by Jack Dean (Michael Redgrave) the Master of an Oxbridge college the well balanced man who represents Blake's horse, while his wife Gwen, the tiger passionately concerned for the world's suffering shows signs of neurosis. The action revolves round her wish to sign a petition for unconditional nuclear disarmament and Dean eventually to save her from mental breakdown bravely identifies himself with her and the cause thereby deserting his philosophy and his career.

In its outcome the play stresses the value of social idealism, stifled as it may be by philosophic detachment and the pressures of conformity. It is typical of Bolt's dialectic that this value should be upheld by the disturbed Gwen and by Louis an oddly irresponsible young man.

Bolt departs from the realistic style by trying to make his characters larger than life in being unusually articulate about what they stand for.

A Man for All Seasons 1960 P

Here Bolt attempts to give his characters heroic dimensions by striking back into history.

Believing that our need today is a sense of personal individuality or selfhood he chooses as his hero of selfhood Sir Thomas More. Bolt consciously uses the dramatist's privilege to adapt history to his own purpose for the theatre of conscience accepted by More was not subjective and existentialist but identical with that of Thomas Aquinas. Hence some inconsistency in his portrayal.

More was described by one of his contemporaries as "a man for all seasons" and Bolt presents More (Scofield) as not only flexibly adjusted to Renaissance society but also preserving an inner core of unassailable integrity. Suspected of a critical attitude to Henry VIII's divorce he used his skill in the thickets of the law yet resolutely refused to swear the oath to the Act of Succession that would have released him from the

Tower and the block became for him perjury meant the loss of the soul the self. His constancy is thrown into relief by the growing corruption of Richard Rich whose final perjury sends More to his death.

Bolt's more challenging comparison with Brecht's *Cheile*. He also is a man of supreme intelligence whose inner certitude of truth is persecuted by an absolute power. He also skilfully avoids open class until he must eventually make a final choice between astute temporising and commitment of his life to his belief. The difference is that More opts unequivocally for constancy.

Bolt uses what he calls a 'bastardized version of Brecht's style. Episodic scenes are strung along a strong thread of intellectual argument. There is also a commentator in the form of the Common Man who with the aid of property box takes a swift succession of minor part-changes of role which throw into relief the steady individuality of More.

Bolt like Brecht believing that beauty of language is a means of 'alienation' matches fine pictures from More himself with his own appropriate use of wit and imagery using images of land to suggest society and its laws and those of water and sea the superhuman context.

The film version has been highly praised.

Centle Jack 1963

Bolt depicts the conflict between the natural spontaneity of nature represented by the magic figure of folk lore Jack of the Green (Kenneth Williams) and the inhibitions of society in the person of Mrs Lazara a plutocrat (Edith Evans). Since Bolt believes that the modern doctrine of the return to nature may lead to violence Jack finally contrives two murders. Bolt in dealing with this conflict could not like Euripides in *The Bacchae* draw on a familiar myth and his allegorical plot proved puzzling while the setting was too reminiscent of *Dear Brutus*. The play is too cerebral the characters are more blue prints than flesh and blood.

The Thwarting of Baron Bolligrew 1965

A play for children over eight was much praised by the critics for inventive and entertaining.

Vuall Vuall Regina 1970

A play with two heroines — Elizabeth I and Mary Queen of Scots. In the same predicament the conflict between royal statecraft and woman's desire for husband child and heir they are in temperament sharply contrasted. Mary is shown as sophisticated sensuous passionate and self-willed ruthlessly conniving at plots to murder her rival Elizabeth listening to Cecil and Walsingham foregoes her love for Leicester in the interest of the realm.

Since the period spanned is virtually that of Mary's return from France until her execution (with just a hint of England's coming victory over the Armada) she is the main dramatic focus although Elizabeth's astute dialogues with her advisers are more interesting.

Bolt does not attempt the subtle complexity of *A Man For All Seasons* but he shows admirable expertise in the handling of space and time. Discarding realistic sets he employs emblematic properties such as thrones pulpits desks and heraldic blazons. Clever selective lighting serves to make viable even the exchange of letters. Thus the action shifts unhindered between places wide apart and moves swiftly through the years.

Edward Bond (b 1935)

Most sensitive people share Bond's appalled dismay at contemporary violence and war the drab monotony of industrialisation and the stifling of individuality but it is not yet clear whether his obsessive images of violence including infanticide are objective or self-indulgent.

He is not yet in control of his material and is apparently animated by intense subjective hostility to all authority. He attempts to rationalise this by a naïve anarchy pontificating that 'Society makes men animals' unaware that he is hitting at an abstraction. Some statements are so solipsistic and perverse as to make his intellectual groundwork suspect.

Said 1965 M

As a result of casual sexual intercourse with the promiscuous Pam Len gets involved with her morose South London family with Fred the putative father of her baby and with Fred's lewd 'cousin' which murders the baby on the stage. Since the play is largely in delinquents' argot and is limited to a photographic study of marginal people it is in itself somewhat mariculate but it constitutes a frank and compassionate social document.

Early Morning 1968

Feshin interprets this play as infantile fantasy. The archetypal authoritarian figures of mother (other nurse and grown-ups appear as Queen Victoria and the Consort at deadly enmity Florence Nightingale on whom Victoria has a Lesbian crush and Gladstone and Dizzy waging civil war. The princes Siamese twins suggest sibling rivalry and the final scene is a nightmare eternity of mutual cannibalism whose psycho-analytic significance is oral eroticism and sadism. Feshin judges the play absurdist innocuous as satire but with an underlying substance of great seriousness and poetic power.

Wardle says Bond is writing like a wrathful omnipotent baby presenting a solipsistic muddle meriting case book study rather than dramatic criticism.

Narrow Road to the Deep North 1968 M

The setting visually very beautiful is 17th century Japan where the War Lord Shogo is eventually overthrown by the Commodore a bragging mindless savage representing Western civilisation with the tambourine banging Georgina a somewhat outdated image of missionary zeal supporting imperialism.

Shogo maintains order by sheer atrocity. Georgina by incantating also a puritan sense of sin the message being that 'Government is evil and our only hope the naked man who finally rises from the river (recalling the Romantic myth of the noble savage).

Bond's dubious dogma overlays the most moving aspect of the play its latent plea for individualism.

Black Mass 1970

For the Sharpeville commemoration Bond wrote a bitter satire showing a priest corrupted by the power of politician and police.

John Bowen

Bowen first won recognition as a novelist.

After the Rain 1967

Bowen dramatises his own novel where after a great deluge ill-assorted survivors drift on a raft and enact a version of history. Meanwhile the dictatorial Arthur imposes on them his authority first as dictator and ultimately as god.

Bowen dramatises this fantasy by setting it in a conventional framework a history lecture given in A.D. 2197 on the origins of the new society descended from the party on the raft. Hypnotised criminals guilty of such crimes as individuality are used at intervals as teaching aids. They enact the story of the raft until eventually Arthur (Alec McCowen) rebels preferring death to his dramatic role.

The lecture serves as a conventional apology to the enactment which eschewing scenery and properties makes use of the experimental techniques of Weiss's *Marat Sade*.

Little Boxes 1968 M

A double bill of realistic well-made plays again shows little communities in isolation. In this instance both groups have withdrawn deliberately from society.

In *The Coffee Lane* a pathetic vaudeville troupe elderly and poverty-stricken have refused to go out since their performance was cruelly ridiculed thirteen years previously.

Trevor shows a young Lesbian couple. One girl anticipating her parents' visit passes an actor to pose as her friend. But both sets of parents arrive and lively farce develops as Trevor attempts simultaneously to attend two parties and to cook a scene. All the parents depart refusing to admit the girls' relationship and the play ends on an sentimental note.

The Disorderly Woman 1960 M

Bowen follows Anouilh in his capable adaptation of a Greek play Euripides's *The Lachae* to a modern idiom.

Bertold Brecht (1898-1956)

Perhaps the most original and vigorous dramatist and producer of the century the Bavarian Brecht was remarkable in his command of both literary and theatrical genius.

His practice and theory underwent constant modification. Early plays like *Baal* written to provide entertainment reveal a satiric and anarchic attitude and in 1928 the ironic *The Threepenny Opera* (P) made him famous. From 1930 onward his work became explicitly communist marked by the rejection of the individual in favour of a social ideal. But although Brecht always remained committed to Marxist ideology most of his later plays written after his withdrawal from Nazi Germany are less didactic than humanist in spirit and it is by these mature works that he is best known in Britain.

After 1949 Brecht consolidated the famous Berliner Ensemble in East Berlin where he developed his influential techniques of production.

The most permanent feature of Brecht's mature drama are the Epic form and the *Verfremdung* or 'alienation' effect both developed in reaction to the traditional dramatic form which he dubbed Aristotelian.

He considered that the closely constructed Aristotelian play which encourages the audience's emotional participation in the action syphons off the spectator's emotion leaving him a passive and acquiescent member of society.

According to Brecht the drama should be not ritual but debate. The spectator should be a detached observer calmly investigating the view of the world that confronts him rationally considering arguments and stimulated to decisive social action. It is taken for granted that he will find the solution to problems in communism.

Brecht therefore developed his Epic or narrative play loosely constructed with a sequence of individual scenes functioning as independent dramatic illustrations or quotations to the narrative.

He uses a variety of techniques to establish the narrative tone such as an actual story teller on the stage explanatory verses relayed before the scenes and banner headlines which foretell the events to be portrayed. Although by throwing the action thus into the past tense he discards the lure of suspense his dramatic intelligence vigour and inventiveness excite lively interest and curiosity.

To break down the traditional identification of the spectator with the action Brecht developed his celebrated alienation effect devising techniques to keep him at a critical distance. This implies using an image that suddenly makes the familiar appear strange and novel to the onlooker so that he is shocked into recognising its significance.

His productions were thus avowedly non realistic and theatrical sometimes appearing like an inspired charade. He used not only direct narration but direct addresses to the audience formalised settings and properties masks and stylised make up sometimes grotesque in character. His text scarcely more than a prompter's copy was freely adapted during rehearsal so that an acquaintance with the pattern of Brecht's mime and gesture is often necessary to the full understanding of his plays.

Few find in Brecht's mature work the plea for communism that he intended and many of his protagonists designed as exponents of capitalist military appeal strongly to the sympathy. The compelling and fascinating central ambiguity can be ascribed as Esslin has pointed out to the

tension between Brecht's conscious reason and the unconscious emotional experience on which every creative writer must intuitively draw. This profound tension is the major source of Brecht's power.

Brecht's influence has been pervasive especially on the dramatists Arden Bolt Whiting and Caffer and on the producer Joan Littlewood. Above all his iconoclastic attitude and his fertile experiment have been invaluable in encouraging a new and empirical approach to drama.

Esslin's book *Brecht: a Choice of Evils* 1959 is authoritative.

Baal Written 1918

The amoral vagabond poet Baal (O Toole) driven by instinct and emotion expresses the subjective experience of the youthful Brecht.

Galileo Written 1938-9 M

Brecht intended Galileo's recantation as an image of the scientist's allowing the State to assume authority over science. It has also been interpreted as Galileo's cunning expedient allowing him to continue research.

Mother Courage Written 1939 M

In his panorama of war's futility Brecht designed *Mother Courage*—a camp follower in the Thirty Years War—as an epitome of the hapless profiteer. But his intuitive understanding of this dynamic maternal figure bereaved eventually of all three children has endowed her with an ambiguous fascination.

The Good Person of Szechwan Written 1938-40 M P

Shen Te (Peggy Ashcroft) the benevolent prostitute has to disguise herself as Shui Ta, the harsh task master in order to survive in an unjust commercial society.

Pantula Written 1940-1

The drunken generosity of the mean land owner Pantula designed by Brecht to highlight his harshness when sober has however given him an attractive inconsistency. The chauffeur who rejects Pantula's daughter is a Schweikian character.

The Resistable Rise of Arturo Ui Written 1941

The late British premiere 1967 of a minor play vividly illuminates Brecht's principles and method. The Chicago thug Ui and his cronies burlesque Hitler and his entourage and the horror of Nazism is offset by the brilliant clowning by Possiter of Ui's abject cowardice and monstrous arrogance. The play successfully parodies Shakespeare's verse especially in *Richard III* but the picture of Chicago gangsters as vegetable dealers is unconvincing.

The Caucasian Chalk Circle Written 1944-5 M P

The prologue to this delightful fairy tale constitutes an overt plea for communism rare in Brecht's later work. The rascally judge Adzal who takes bribes from the rich and gives judgment in favour of the poor is one of Brecht's typical contradictory characters.

Peter Brook (b 1925) Director
US (or ambiguously *US*) 1966

US is a collaboration between director actors designers musicians and writers in an attempt to confront the Vietnam war and to involve the audience.

Brook admits anti American bias.

The First Act is a violent theatrical assault on apathy. Brook re-employs techniques from Weiss's *Marat-Sade* and alternates utmost stillness as in the initial mime of a Buddhist self immolation with loud music and noise. In the hideous uproar and confusion of a bombing raid at the climax a giant war effigy from the proscenium

crashes across the stage. Shattering assault is succeeded in Act Two by a penetration in depth, its centre being a dialogue between a white man about to burn himself alive and a girl whose cold detached criticism gradually gives way to a bitter indictment of English parochial indifference. In an ambiguous poetic finale an actor silently releases butterflies one of which he burns.

This daring and controversial use of theatre directly to involve the emotion of the audience in confrontation with contemporary political tragedy in its mark a new departure.

Albert Camus (1913-60)

It was the French existentialist philosopher and novelist Camus who first enunciated the concept of the Absurd, describing it as whatever in human existence is incompatible with man's desire for reason, justice, happiness and purpose.

Lil e Sartre Camus expressed his views through the traditional dramatic form and the plays most familiar here were those written before he had moved on to a more humanistic philosophy.

Caligula French publication 1940 P

The Roman Emperor Caligula suddenly decides to act in accordance with the absurdity of the universe and by his violent and perverse crimes forces on the Senators his own recognition of the absurd meaningless of existence.

Cross Purposes French publication 1945 P

Man's futile desire for happiness is dramatised in the legend of the mother and daughter who murder for gain the visitor to their inn, only to discover they have killed the son of the house. They then commit suicide.

Paddy Chayresky (b 1923)

The Latent Heterosexual 1968

This American play begins as a hilarious caricature of homosexuality and drug addiction, is embodied in the outrageous poet Morley H., novel has just earned him \$72,000 and his accountant advises him to evade taxation by a token marriage and by turning himself into a Corporation.

The marriage to an expensive prostitute is a sensational success but soon the Corporation usurps Morley's personal identity. Almost paralysed he makes a frantic effort to liberate himself and can find his only resource in suicide.

The remorseless and impressive final scenes change the tone of the play and constitute a serious satire on the atrophy of the human personality by Big Business.

Giles Cooper (1918-66)

Everything in the Garden 1962 P

Cooper deftly uses sophisticated comedy for a sharp satire on the sacrifice of principle to money in an effeminate bourgeois society. Four bored middle class wives become part time employees in an exclusive brothel while their complaisant husbands enjoy the tax free profits. There is a sudden horrifying change of key when at a party a neighbour realises the position and the four men destroy this outsider in a kind of ritual murder. In Cooper a second version the play returns rather shakily to the comic vein.

Happy Family 1966 P

Cooper's last play outwardly a light witty comedy is an incisive assured satire on arrested development and snobbish exclusiveness.

For the well to do Mark and his two sisters nobody exists outside the family trio and they employ their leisure with nursery games, jingles and punishments. When the elder sister introduces a fiancé he at first serves as catalyst, but he also is retarded, a grocer's assistant posing as solicitor, a nobody, to the sadistic Mark who soon contrives that he shall be ousted from the family circle and the nursery prattle resumed.

The bizarre situation skilfully dramatises in difference to others and obsession with the clutter of the past that stifles natural growth.

It is illuminating to contrast Truitt's use of the same family triangle.

Shelagh Delaney (b 1938)

The young Salford girl attracted attention with *A Taste of Honey* 1958 (M) and *The Lion in Love* 1960 (M) her last play. The artless candour of their portrayal of seedy workers and drifters was then a novelty and they owed much to the revision and production by Joan Littlewood (q.v.). Only *A Taste of Honey* now retains any significance, its unconventional subject being the pregnancy of an adolescent expecting a black baby and befriended by a homosexual youth.

Nigel Dennis (b 1912)

Dennis also a novelist, is a satirist in the tradition of Voltaire. In a Shavian preface to his first two plays he uses arguments sometimes more sparkling than valid to attack his favourite targets—the doctrine of Original Sin and the assumptions of psychoanalysis (see J42). He urges that both undermine self reliance and tend to delegate power over the mind to a hierarchy which may threaten personality.

Dennis adopts a Shavian dramatic style and his vigorous first acts have strikingly novel situations and witty dialogue. Then satire tends to divert interest from the characters holding up action and weakening structure as in some of Shaw's later plays.

Cards of Identity 1956

The play was adapted from Dennis's novel. An Identity Club exploits psychological techniques to induce local people into accepting changed names, memories and identities and then uses them as servants. Only in face of their Bank Manager do the victims discover themselves! Dennis infers that the basis of personality is memory which the psychologist can so edit as to manipulate personality—a thesis not verified by any appeal to scientific evidence.

The Making of Moo 1957

A colonial civil servant has weakened the taboo on murder by unwittingly killing the river god. He invents the new religion of Moo complete with mythology, ritual and ethics. In this bold satire Dennis exposes similarities between the efficacy of pagan ritual sacrifice and the doctrine of Atonement. In his preface he suggests that to conform to a religious sect is to belong to an Identity Club.

August for the People 1961 P

A satire on the tameness of the public when admitted—at a fee—to stately home lacks the pungency and inventiveness of Dennis's early work.

Marguerite Duras (b 1914)

The French novelist and script writer of the film *Hiroshima Mon Amour* has a sensitive flair for dialogue and for exploring the ebb and flow of feeling. Her naturalistic plays move subtly towards their climax, often the agony of parting as in the one act *La Musica* 1966 (P).

Days in the Trees 1966

The theme of the play, virtually a trio, is the love-hate relationship between mother (Peggy Ashcroft) and son. She had indulged her own emotions by conniving at his playing truant for whole days in the trees, so that he is now incapable of love for anyone else. Finally the ageing woman admits to herself her callous egoism and misery as now a gambler and pimp he lives contemptuously with the devoted girl for whom he procures.

Friedrich Dürrenmatt (b 1921)

The German Swiss Dürrenmatt acknowledges the Greek dramatists Shakespeare and Swift as major influences. He describes his work as theatre of paradox revealing precisely the paradoxical effects of strict logic. He is an unflinching critic of contemporary society whose numerous tendencies he exposes in striking and bizarre fictions reminiscent of the later Shaw.

The Marriage of Mr. Mises 1959

An extraordinary pose, the opposition between two principles carried to their logical and farcical extreme. One is a passion for the law of Moses interpreted as retributive justice. The other is pure Marxism. The two characters embodying these principles together with a Quixotic lover are manipulated and destroyed by an unscrupulous politician.

The Visit

An old multi-millionress revisits her birth place and offers the inhabitants £1 000 000 to murder her former lover who had denied her paternity order. Gradually persuading them selves that they are acting justly they comply.

Dürrenmatt cleverly maintains suspense in his withering satire on love of money, hypocrisy and the symphony of press and radio.

The Physicists 1968

Dürrenmatt has said that this arresting play is not so much about the hydrogen bomb as about society itself and the impossibility of escaping the consequences of one's thinking.

The central character attempting to suppress scientific discoveries that may lead to the hydrogen bomb retreats to a private asylum pretending to be in contact with King Solomon. There he is first in danger of two spies pretending to the delusion that they are Einstein and Newton and eventually of the mad proprietress whose use of his discoveries will lead to the destruction of the human race.

The Visit 1966

Another play of paradox has as hero a man who wishes to die but cannot.

Schwitter (Patrick Magee) famous dramatist and Nobel prizewinner already proclaimed dead in hospital returns to the garret of his youth to die in vain. As the old egotist swags drunk makes love one by one those who touch his orbit meet their death.

The symbolism is unclear. Is Schwitter the egoistic kind of artist who feeds on the lives of others? The most effective incident—his dialogue with an ancient tart—cynically suggests that his art also has been prostitution for he too has supplied artificial emotion to meet public demand.

The chief weakness of the play is that the surprise wears thin. An original idea adequate to a one act play has been inflated too far.

Charles Dyer

Dyer's first success was *The Rattle of a Simple Man*.

The Staircase 1966 P

One of the funniest plays concerning homo sexuality is a dialogue between the middle aged Charles Dyer (Scofield) and Harry C Leeds (Magee) during a wretched Sunday night in their poky barber's shop in Brixton the cage they have co-habited for twenty years.

Charlie is sadistic aggressive cruel. Harry a messy talker is softer protective. Their endless squabbling in ribald argot comic and searing vents their exacerbated irritation but underneath is glimpsed the pain of social isolation the mother fixation the frustrated hankering for offspring the fear of exposure.

T S Eliot (1888-1965) See also M24

In his attempt to revive poetic drama the distinguished poet T S Eliot was moved by deeply religious and social aims modestly regard-

ing his work as experimental that of the first generation only. The verse he evolved was of a flowing poetic rhythm close to contemporary speech and based on natural stress. Normally he used a line with three stresses and varying length.

In his two plays of the thirties Eliot had adopted the ritualistic themes and patterns of Greek drama and had achieved a certain tragic intensity. But the *Cool Tail Party* inaugurated a new style the theme still being Christian redemption and the plot deriving from Greek drama but the idiom that of the fashionable comedy of manner. In spite of subtle organisation the reason has been an uneasy one.

It is curious that the creator of *Prufrock* should seem unable fully to animate his dramatic personae. This is partly because their inspiration is literary partly because they are used to illustrate Anglican doctrine and to convey a message. Nor do they belong to the impeccable background against which they are so carefully placed.

The wealth and subtlety of reference of these plays and the beauty of the language make them a delight to the reader but they are less compelling on the stage.

The Cool Tail Party 1949 F

This play revived in 1968 has its literary origin in Euripides' tragic comedy *Alceste* the demi god Hercules being replaced by Reilly the psychiatrist whose intervention breaks the back of the play for it is not easy to sympathise with people who let their actions be so directed.

The Confidential Clerk 1953

Described as high farce this play derives from another tragic-comedy of Euripides the *Ion* whose theme of parents seeking their lost children reappears in Terence Plautus and Shakespeare.

The Elder Statesman 1955

Eliot here returns to a tragedy the *Oedipus at Colonus* of Sophocles but the youthful peccadilloes of Lord Claverton appear pallid compared with the patricide and incest of Sophocles' protagonist.

Jules Feiffer

Feiffer the New York strip cartoonist of international fame now writes plays.

Little Murders 1967

The blustering Newquist family of New York embody what Feiffer has called the national paranoia in face of random violence and when the daughter Patsy introduces her fiancé Alfred who is so strong that he never retaliates they are incredulous. But Patsy is killed by some stray bullet. Alfred adopts the Newquist ethos and the family is happily united sniping down harmless passers by.

The main theme is clear. Man hates war but is fascinated by it. Peace is a Sissy. The play began as a novel which may account for the plethora of other stimulating ideas which are never fully integrated and also for some highly entertaining satirical vignettes not entirely relevant.

God Bless 1968

This Shavian satire scintillates with dramatic and verbal paradox epigram and ironic understatement and improves on reading.

It is timed in the immediate future with America waging war in three continents and is set in the library of the Liberal Brackman (Dotrice) America's oldest elder statesman.

On his 110th birthday he is critically dictating the record of his shilly shallying career used by Feiffer as an image of the American Liberal compromise as a betrayal of principle a sell out. His narrative is punctuated by teletype and television presentations of mounting insurance action off stage. Then two heavily armed agitators for Peace and Civil Rights formerly Brackman's Harvard students enter soon to be followed by the President himself.

As forty six cities go up in flames the President reveals that the agitators have actually been

financed by him as a tactic to shake up Congress' But his tactic has gotten out of hand and while Civil War breaks out the four men settle down to effect yet another compromise The revolutionaries insist on bombing ten cities but the President is to decide which ten!

The play operates as an urgent warning

Michael Frayn

The Two of Us 1970

A quartet of sketches each involving only two actors (Richard Briers and Lynn Redgrave) ended with a hilarious playlet which had the genuine technical virtuosity of the Feydeau farce

Max Frisch (b 1911)

Frisch a German Swiss who has been influenced by Shaw and Brecht dramatises current issues in ingenious apt and witty parables that have a lucid economy of outline

The Fire Passers 1961 M

A delightful Absurdist satire on bourgeois self delusion and ineptitude shows Biedermann (Alfred Marks) persuading himself that he can cajole the incendiaries about to set fire to his house by inviting them to a good dinner The situation is analogous to that of Benes of Czechoslovakia who included communists in his government and to that of the Germans who connived at Hitler

Andorra 1964 M

An incisive and moving satire on the vicious pervasiveness of antisemitism shows the Andorran betrayal of the lad Andri reputedly a Jewish foundling to the invading totalitarian state Andri is in fact a Gentile and his assumption of Jewish traits is an example of identity imposed from without by society

Christopher Fry (b 1907)

Fry widely acclaimed in the forties for bringing verse back to the stage has written comedies and religious plays the latter culminating in *A Sleep of Prisoners* 1961 commissioned for enactment in churches during the Festival of Britain

Fry devises ingenious situations often in terms of poetic fable informed by implicit affirmation and hope lightly and gaily conveyed His special talent is the creation of a dramatic atmosphere unique to each play But like *Love's Labour's Lost* they tend to be too static and are carried by the dynamic and magic of verse His delightful early verse was sometimes too lavish and discursive and with *Curtmantle* he began to use a plainer style with brief telling images

His maturer work completes the quartet of the Seasons that had begun with the Spring comedy *The Lady's Not for Burning* 1948 O U P and *Venus Observed* 1950 O U P an unusual and felicitous comedy of Autumn

The Dark is Light Enough 1954

In a play of Winter an eccentric and saint like old Countess (Edith Evans) gives asylum to men of both sides in the Hungarian rising of 1948 The theme of non intervention is presented with an elegance that saves it from didacticism

Curtmantle 1962

A vigorous play has as tragic protagonist Henry II shown as an imperious autocrat brilliant generous and headstrong Redeeming England from anarchy by his firm foundation of Common Law he yet makes the tragic error of promoting as Archbishop his tried friend, Becket who then proves intransigent and inconsistent and triumphs by his martyrdom

With remarkable skill Fry incorporates the truly tragic hero and emotional power of the Aristotelian play (g.e.) in a work modern in structure The main themes interpenetrate the progressive discovery of Henry's contradictory personality in his relations with Becket his people and the wife and sons who deserted him,

and the interplay of different laws The drama moves swiftly through the years 1198-89 the events successfully telescoped as in William Marshall's memory

Some prose is appropriately used and the poetry is disciplined and vivid

A Yard of Sun 1970

It is July 1946 in Siena time of the first post war Palio that tense horse race which is also a galvanic liturgy of life In war's aftermath two neighbouring families strive towards renewal

In one there are still brothers conflicts to be resolved Angelino's eldest son the rebellious Roberto ex Partisan now a devoted doctor is scathingly scornful of easy going Luigi ruled politician and Blackshirt and also of the long missing Edmondo who suddenly turns up A war profiteer Edmondo is smugly eager to use his financial expertise to contrive the families' fortunes

Unwillingly Roberto is stirred by Edmondo's dazzling wife embodiment of the passionate excitement of the Palio But her husband's machinations go comically awry and they soon depart

Roberto now realises that he loves the simple Grazia daughter of the neighbour Gioietta whose putative husband has just returned from a concentration camp and now believes in his duty to return to his legal invalid wife There is a hint of union between Gioietta and Angelino

Although the scheme of this quiet humorous comedy is somewhat too neat and flat it is true to its theme of resurgence The fruits of Autumn may come The poetic imagery well expresses the differing personalities and the volatile Italian temperament

Athol Fugard (b 1932)

Fugard now has his own Theatre Group in his home town Port Elizabeth

The Blood Knot 1966 P

Of two brothers belonging to the mixed race of Cape Coloureds one tries for white The dialogue between them both comic and naïve and fraught with intense love and hate is a microcosm of the terrible strains imposed by racial segregation

People Are Living There 1970 O U P

In a shabby lathen in Johannesburg Milly the slatternly kindly landlady who has just been thrown over by her lover her German lodger vainly tries to whip up a frenzied party for her fiftieth birthday The only other participants are Shorty a retarded poor white and the student Don too immersed in Sartre's anguish to do anything else

They get down to the grim rock bottom of mutual self knowledge of society's indifference to poverty of the loss of youth and joy in the inevitable ageing process measured by the frail chiming of a shaky grandfather clock Only Milly's sense of humour at the ridiculous plight of the whole animal world preserves their precarious companionship

This compassionate play recalls Sartre's *In Camera* but has a more valid conclusion than Sartre's dictum hell is other people

Jean Genet (b 1910)

The French Genet abandoned as a child has lived as social outcast and criminal and while politically uncommitted has mirrored his bitter repudiation of society in plays of frightening impact

His dramatic personae have been the rejected murderers (*Deathwatch* (F)) despised servants (*The Maids* (F)) prostitutes (*The Balcony* (F)) Negroes (*The Blacks* (F)) and Algerian peasants (*The Screens*) These have realised their fantasies of sex power violence and revenge only by compulsive ritual acts so that sequences of arresting ceremonial sometimes Absurdist replace character study and coherent plot

In his destructive scorn of contemporary society his recourse to rituals of violence and his incantatory language Genet satisfies the requirements of André's Theatre of Cruelty

The Voids 1956 F

Two sisters maids to a fine lady continually take it in turn to enact the rôle of mistress and maid so that each can vent her envy and rancour on the mistress. When their plot to murder the mistress misfires one of them herself drinks the poisoned cup of tea.

Their compulsive charade designed originally for a cast of young men, mirrors the obsessive and self-destructing conflict of envious love and hate in the mind of the outsider.

Triana's *The Criminal* has a similar theme and technique

The Balcony 1957 F

This censored play had its world première at the Arts Theatre Club. It opens in a brothel where the frequenters enact their fantasies of power by dressing up as bishop, judge or general until after an abortive revolution they are called upon by the Court to impersonate these authorities in actuality. Eventually the defeated revolutionary leader visits the brothel to enact the part of Chief of Police who is then satisfied that his image also has been established in popular regard. The film gives a softened version of the play.

Günter Grass (b 1927)

Grass a notable German novelist and author of some early absurdist plays has recently written propaganda for the Social Democratic Party of Federal Germany

The Plebians Rehearse the Uprising 1968

Produced here first by amateurs in 1968 and then by the RSC in 1970 *The Plebians* is set in a theatre in East Berlin. The date 17 June 1953 is that of the spontaneous yet formidable rising of the workers in East Germany against the Ulbricht régime.

The play—not a documentary—imagines a situation in which the Boss clearly a counterpart of Brecht the dramatist producer is rehearsing his Germanised version of *Coriolanus* whose protagonist is the aristocrat who spurning the rebellious plebians all but betrays his country.

Into the Boss's theatre intrude rebellious workers asking him to write a manifesto which will give coherence to their inarticulate demands. But the dramatist who has indefatigably urged intelligent revolution scorns their amateur incompetence. Despite the advice of his wife he temporises exploiting the workers' gestures and tape recording their dialogue as material for his own play.

Finally moved by the enthusiasm of a girl herself inspired by Katrin in Brecht's *Mother Courage* (qv) the Boss resolves to support the uprising. But already the Russian tanks are moving in. Bitterly he realises that he has himself played the part of Coriolanus.

The play reflects not only Grass's disquiet about Brecht's rôle in a satellite dictatorship. It concerns the predicament of the modern artist—that of Grass himself—as to whether art or political commitment should take precedence. A significant minor incident in the play is that the response of the University to the workers' cry 'Intellectuals Solidarity' is merely to bar their windows.

Grass clearly indicates that the lack of effective support of artists and intellectuals to the revolution they advocate results in a tragic cleavage in the nation—hence the sub title *A German Tragedy*.

David Halliwell

Little Malcolm and His Struggle Against the Eunuchs 1965 F

A deliciously funny send up of the angry young man cult is located in a Huddersfield garrett.

Here Malcolm a beatnik ex art student compensates for his inadequacies—professional and sexual—by fantasies of Hitlerian power. He imposes on his three chums his farago of 'Dynamic Insurrection' which so distorts reality that they all finally beat up the nice girl who wants to help Malcolm.

The sources of disaffection and violence are scrutinised incisively but with sympathy.

K D Dufford 1969 F

Dufford like Malcolm a fantasy ridden mediocre commits child murder in order to hit the headlines. Too much interest is diverted from his fantasy to conflicting interpretations of his crime.

Christopher Hampton (b 1946)

When Did You Last See My Mother? 1960 F

Hampton frankly explores the predicament of the adolescent. Ian a bitterly alienated homosexual in his triangular relationship with a former school friend Jimmy and with Jimmy's mother.

Total Eclipse 1965 F

The story of Verlaine's passionate infatuation for the younger poet Rimbaud (prototype of Brecht's Baal) is dispassionately and convincingly presented almost like a chronicle the opening and closing scenes being particularly skilful.

The Philanthropist 1970 F

An ingenious comedy ironic parallel of Molière's *The Misanthropist* (M) is set in the near future in the room of a bachelor Don Philip the philanthropist.

In an arresting *coup de théâtre* an aspiring dramatist trying to convince Philip and his friend Donald of the likelihood of his protagonist's suicide unfortunately blows out his own brains.

Shortly afterwards a dinner party for six occasions some brilliantly precise and apt repartee. As in Molière the characters are boldly delineated and effectively contrasted. Philip a literal minded philology don disclaims critical judgment but is fascinated by words in isolation his lonely pastime devising anagrams. So anxious is he to please that he is terrified of hurting people but his mumbling evasions give more offence than Don's trenchant criticisms.

The evening culminates in comic farce. Philip too imperceptive to realise that his fiancée Celia wants to stay lets her be taken home by an unscrupulous acquaintance and out of pique she sleeps with him. Meanwhile Philip is too timid to refuse the nymphomaniac Araminta who stays the night under conditions too appalling to relate.

Next day Celia, having discovered Araminta at breakfast returns again to break off her engagement with one too weak to control her. Philip crestfallen decides to approach Liz only to find that she has spent the night with Don!

Harking back to Scene 1 Philip transposes. Imagine the theatre as real into. I hate these sterile anagrams. Then taking a cigarette and a small pistol he goes to join Don and Liz. Is this ambiguous finale a token suicide. Philip having previously given up smoking for fear of cancer or does the anagram indicate a new fruitful involvement in life?

The significance of this bourgeois comedy is further appreciated by comparison with Molière's comedy of manners.

A common theme is the follies of the age. In Molière courtly hypocrisy in Hampton growing indifference to violence. Don's hilarious report of the news that an unhinged Tory disguised as a woman has mown down half the Cabinet is discussed with cool nonchalance. Only Philip is appalled.

Hampton's characters are of the same metal as their prototypes but the coin is reversed. The idealistic misanthropist Alceste rebukes flat terers even his beloved the coquettish Célimène finally deciding to withdraw from society. The gentle Philip is in his privileged vocation already withdrawn, but lacking the courage of his own

lack of convictions diffidently condones even the frivolous Celia.

But Hampton's focus has shifted from a man's passion for woman to friendship between two men. The play is too derivative to be entirely self-subsistent but Hampton skilfully incorporates a subjective penetration of Philip's complex nature into his meticulously structured comedy.

Michael Hastings (b 1938)

Hastings' *Don't Destroy Me* was produced when he was 19. *Yes and After (P)* appeared in 1957.

The Silence of Lee Harvey Oswald 1966 P

The play, an example of living theatre, begins with a straightforward narrative of the assassination of Kennedy illustrated by film sequences and stills.

Then verbatim passages from the official interrogation briskly alternate with imaginative reconstructions of Oswald's domestic life—a technique which diffuses the sense of authenticity.

Rolf Hochhuth (b 1931)

Hochhuth like his predecessor Schiller is specially interested in the historical play, using poetic licence to organise and adapt factual material to his own dramatic purpose.

The Representative 1963 M P

Using some dramatic personae who represent historical personages, this play in verse exposes the failure of Pope Pius XII. Chiet's representative to protest against the massacre of the Jews. Film sequences of the horrors of Auschwitz are used with harrowing effect.

Soldiers 1968

Hochhuth's moderately long play had its genesis in his horror and protest at the bombing of non-combatants. It is set symbolically at Coventry Cathedral but contains a realistic play within the play, the only part produced in 1968 and here discussed.

This is timed for the crucial months May to July 1943 and historical persons are assigned fictional parts. Hochhuth embodies his theme by presenting Churchill as the eminence grise who advocates to Churchill (John Colicos) the coming protagonist a policy of ruthless saturation bombing. The theme is counterpointed by the suggestion that success in modern warfare demands not only barbarity but treachery. This is given personal urgency in Churchill's confrontation with his ally, the Polish General Sikorski whose intransigent hostility to Russia was proving a threat to our precarious alliance with Stalin.

Hochhuth's sensational insinuation that Churchill connived at Sikorski's death is a striking and poignant dramatic image and is defended by some critics on the grounds that a play is an agreed fiction. Hochhuth himself, however, claims to have seen secret evidence and has by some been sharply criticised for traducing Churchill when he cannot produce this.

In the final Act Bishop Bell is presented in a fictional impassioned protest to Churchill against civilian atrocities, but the arguments assigned to him do not unfortunately proceed to their logical conclusion that modern warfare is *per se* an atrocity and here the moral pressure of the play is dissipated.

Hochhuth boldly handles his dominant themes while organising the intricate political detail in a gripping and enthralling way. The presentation of historical characters is remarkably convincing and Churchill emerges as an idiosyncratic massive and tragic hero, fully aware of his moral dilemmas and ironically prescient of his role as the servant of history in winning a war that destroyed the balance of Europe.

Donald Howarth

A Lily vs Little India 1965 P

Two households are revealed simultaneously. Alvin nagged by his promiscuous mother finds

some confidence in growing a lily bulb. This brings him into touch with Anna, an older spinsterish girl keeping house for her widowed father and eagerly corresponding with Maurice, her seaman brother. The hesitant friendship between Alvin and Anna is indicated with some charm and distinction.

Three Months Gone 1970

In a sequel Anna, now orphaned, is pregnant after a single sexual encounter with Alvin and tries to keep him at a distance. But the delicacy of their relationship is here swamped by extraneous incidents many of them phantasmic involving the presence on stage of the virile Maurice and his encounter with Alvin's mother.

Eugene Ionesco (b 1912?)

Ionesco, one of the leading Parisian playwrights of the Absurd, differs from Camus and Sartre in that he expresses his conviction of life's absurdity not rationally but through images that are in themselves absurd.

In 1948 while learning English from a primer Ionesco stumbled on his vocation; his shocked reaction to the platitudes he was memorising being dramatised in *The Bald Prima Donna*. Here he singled out aspects of contemporary life which remain as the chief targets of his ridicule.

One is the empty myopic existence of the petit bourgeois; his lack of passion and thought; the yielding to conventional pressures; the urge to conform. Another is the degradation of language which, stereotyped and inadequate, has become nothing but clichés, empty formulas and slogans.

Ionesco's sense of life's absurdity has deep roots for he is keenly aware of the anguish of the modern world of the fight from reason both tragic and absurd in its potentialities. He believes that by dramatising his own inner hurt he can best reveal a universal experience. In *The Shepherd's Chameleon* he has plainly stated that for him, the theatre is the projection on to the stage of the dark world within—the world of dream, anguish, dark desires, inner contradictions and obsessions. It follows naturally that he is little preoccupied with specific social problems. Regarding the human condition as wider and deeper than the social condition, he dislikes any kind of political message or conformism and deliberately repudiates the committed and didactic play.

Iconoclastic in both his principles and technique, Ionesco—as he indicated in *Fictions of Duty*—has challenged most dramatic assumptions including realism, the concept of the Aristotelian play, consistent characterisation, motivation, plot and the distinction between tragedy and comedy.

Discarding so much, Ionesco has evolved a new technique of shock tactic using most ingenious theatrical devices to express his convictions. He attempts to go right down to the very basis of the grotesque, the realm of caricature, to push everything to paroxysm to the point where the sources of the tragic lie. To create a theatre of violence—violently comic, violently tragic.

In his plays as in those of Pinter, the traditional dividing lines between tragedy and comedy melt away for his amusing images are at the same time poignant, expressing as they do human dis-appointment and folly so that his hilarious comedy may have a tragic import.

A characteristic technique is the use of proliferating material objects which externalise the anxieties of his characters—an accumulation of chairs or eggs for instance, or an expanding corpse. He hopes thus to make the stage settings speak to translate action into visual terms, to project visible images of fear, regret, remorse, alienation.

The discarding of proved theatrical techniques is risky. Shock tactics are successful only as long as they surprise by their novelty. It is a measure of Ionesco's talent that he continues to invent the novel and arresting.

In two of his most recent plays, *Rhinoceros* and *Exit the King*, the nihilism for which Ionesco has been criticised has been relieved by the assertion of the human value of fortitude.

Ionesco's plays were introduced into England in the fifties and they have had a marked and specific

impic on English drama especially on Simpson and Saunders. Although Pinter has a philosophy and style all his own his work is based on similar presuppositions.

The Bald Prima Donna Written 1948

Characters from an English language manual come to life and pour out their clichés in a parody of a play which Ionesco first considered to be a tragedy of language but which proved theatrically very funny. The first dialogue between husband and wife is now a cliché.

Thus Ionesco almost by accident wrote the first of many satirical exposures of the sterile language of those who live a merely mechanical existence.

The Lesson Written 1950 P

A nervous old professor coaches an eager young girl. Elaborately proving the impossibility of communicating by words he arbitrarily decides what various words shall mean until he rapidly gains assurance and eventually rapes and murders his pupil the fortieth that day.

Ionesco illustrates the prostitution of language as a means to power, the sexual element in power and the sadism lurking in the teacher-pupil relationship and indeed in all authority.

Jack Written 1950

Urged by his conventional family to settle down to married life the Bohemian son Jack resists. Roberte the proposed bride because having only two noses she is not ugly enough. He eventually succumbs to Roberte II with three noses. Ionesco parodies submission to bourgeois conformity.

The Chairs Written 1951 P

An ancient concierge and his wife prepare for a crowd of guests who are to hear his final message to posterity. As the totally invisible guests arrive the couple fetch more and more chairs for them until with the entry of the professional orator who is to pronounce the message they jump into the sea. But the orator is deaf and dumb and his writing on the blackboard is a meaningless jumble.

The empty chairs constitute a most effective theatrical image for man's failure to communicate and the dumb orator makes the record of a life time seem utterly futile. It may also suggest how meaningless can be the words of author and actor. Ionesco says: "The theme of the play is nothing less made concrete."

Victims of Duty Written 1952

By transforming a detective into a psychoanalyst Ionesco argues that there is little difference between the psychological drama and the mere detective play.

Amédée Written 1953 P

A corpse in the flat of a married couple constantly growing at a frightening rate is a gruesome and appropriate image of their dead love.

Rhinoceros Written 1958 P

More and more rhinoceroses appear in a small provincial town. They are the inhabitants who one after the other want to be turned into these thick skinned aggressive animals. Finally only Bérenger (Olivier) resists the urge to conform.

The terrifying lure of conformity is here skilfully and movingly illustrated.

Exit the King Written 1963

In an agnostic counterpart of the 15th century *Everyman*, Ionesco shows King Bérenger (Alec Guinness) in his disintegrating palace reluctantly submitting to the process of dying his final resource being fortitude alone. This dramatic elegy inspired by the final scenes of Richard II is designed with bold simplicity presenting man's mortal dissolution with unflinching honesty and a tenderness new in Ionesco.

Alfred Jarry (1873-1907)

Ubu Roi 1906 M

In 1896 Jarry initiator of the Pataphysics movement scandalised Paris with his startling *Ubu Roi* precursor of Absurd drama.

The characters appear as grotesque puppets shocking and comic. The shameless *greceur* Ubu caricatures both Macbeth and bourgeois vulgarity and in his brutal conquest of Poland becomes a monstrous prototype of ruthless cruelty.

Ann Jellicoe (b 1928)

Ann Jellicoe's initial work as producer has left its mark on her plays.

Discounting the concept of man as a rational creature and stressing that people are driven by emotions she concentrated in her early plays on people in a highly emotional and irrational condition. She deliberately tried to stir up in the audience the emotions portrayed on stage employing violent stimuli—a barrage of visual action rhythm sound and sheer noise. Words were reduced to a minimum and these few frequently incantatory and meaningless. Ann Jellicoe wanted the audience to yield unthinkingly to the emotional impact and to refrain from asking "What does this mean?"

While these plays were often intense and exciting they were severely limited in range and manner and to some degree obscurantist. The emotional is only one aspect of human experience and it is inextricably entangled with intellectual experience which is just as valid. To dwell almost exclusively on the irrational to the neglect of coherent speech—man's hard won tool of thought—is partial and misleading.

The function of the artistic image is so to reveal aspects of experience that they can be recognised and harmonised and to elucidate the significance of the image intelligence is necessary.

In later work Ann Jellicoe appears to have discarded her theories.

The Sport of My Mad Mother 1907 F

A gang of Teddy boys living in terror of another gang which never appears is dominated by the fierce and enigmatic Greta. Exulting in their feelings of violence they express themselves in articulate and dissonant words and phrases staccato cries and incantatory songs. Film commentator emphasises these with a set of instruments including a motor horn which makes sounds that are often discordant and a rhythmic.

All this makes a receptive audience aware of what it may feel like to belong to an adolescent gang but Greta is not easy to accept. A mother-schoolmistress figure she finally gives birth to a child and is an embodiment of the Indian goddess Kali. The epigraph of the play is "All creation is the sport of my Mad Mother Kali." Ann Jellicoe explained that the play is based on myth and uses ritual bodying forth fear and rage and being rejected from the womb or tribe. Such symbolism demanding an interpretation of its significance is out of key with a play so deliberately anti intellect and restricted to a direct emotional impact.

The Knack 1961 F

The knack in question is that of getting girls and three out of the four characters are frankly exposed in the irrational grip of sex. The inhibited Colin struggles with the over experienced Tolen for the possession of Nancy (Rita Tushingham) and again the action is carried forward as much by improvisation as by coherent speech. The film version captures the play's spirit.

Shelley 1965

A lucid well documented chronicle play illustrates incidents in Shelley's life. But the simple straight line structure is not suited to the complexity of poetic genius. The personality that emerges is that of the selfless social idealist and pamphleteer and the theme his theory of free love involving Harriet and Mary in disaster. The predicament is viewed from the woman's angle.

and the initial germinal situation that with Harriet is so oversimplified as to be false. The frequent change of brief scenes effective in themselves has a fragmented effect.

The Gleaner 1969

A would be satire on commercial free gift competitions (and television stardom) is too painfully obvious and clumsy to carry any weight.

Jame Joyce (1882-1941) See also M6

Lilies

Joyce's only play rejected by both Yeats and Shaw was after some vicissitudes of production, wonderfully justified under Pinter's direction in 1970.

Its theme is the agony of mind and spirit engendered by a courageous attempt to live beyond the confines of law, convention and habit. Richard Rowan returns to Dublin a famous writer after nine years voluntary exile. He brings Bertha, his wife by common law who had devotedly left Ireland with him and their little son Archie.

Rowan again meets Beatrice who has always loved him and with whom he has for years corresponded volubly about his work. From complex motives partly to assure himself that Bertha's union with him is still absolutely free of conventional ties he encourages her growing intimacy with his old friend and disciple Robert. But Bertha who in her simplicity is envious of Beatrice's education and subtlety of mind feels rejected and confused. Robert that he is acting in an underhand way and Richard that he must be ever wounded by doubt as to their fidelity.

Only parental feeling for Archie and Bertha's profound tenderness for Richard save them. For Bertha with something wiser than wisdom in her heart has an intuitive insight beyond Richard's probing manipulating intelligence. Since Richard is to some degree a self portrait Joyce's objective self criticism is remarkable.

This taut and close knit play in three act and mouse acts where the past is present here now recalls Ibsen.

In its complexity of viewpoint and entanglement of personalities there is ample material for four plays such as Hopkins television sequence *Talking to a Stranger* 1966 (P).

Heiner Kipphardt

In the Matter of J Robert Oppenheimer 1966 M

The play already performed in 23 capitals concerns Oppenheimer father of the A bomb. The source is documentary the 3 000 pages of proceedings before the Personnel Security Board of the US Atomic Energy Commission in 1954.

A hearing taking over a month with 40 witnesses has been condensed and shaped so that evidence is represented by only 6 witnesses. Kipphardt aims was to follow Hegel in stripping away the adventitious circumstances so that the essential situation clearly emerges. He has made a few additions, such as monologues and final statements and all deviations from the literal documents are based on historical data.

The play therefore has an extraordinary authenticity and grip while the central dilemmas are lucidly presented. As *The New Scientist* pointed out it is for the audience to answer the searching questions raised. Was Oppenheimer with his communist connections a security risk? Can a scientist work with state authorities and keep his integrity? Is he responsible for the use made of his discoveries?

Arthur L Kops (b 1938)

Oh Dad, Poor Dad 1961

This play parodies the devouring American 'Mom' who emasculates all her menfolk. She travels accompanied by her husband's corpse in a coffin and dresses and treats her son of 17 as a child. A gruesome Freudian fantasy is presented as a comic tragic farce but there is little latent content.

Indians 1968

The career of Buffalo Bill Cody exemplifies the sweeping theme of America's encroachment on the Redskins. It is focused in the spectacular device of Cody's famous Wild West Show where imprisoned Indian Chiefs had been specially released to reenact their former resistance. Cody at the climax faced by the accusing ghosts of Red Indians voices America's complicity at their virtual extermination.

Bernard Kops (b 1929)

Kops who was born in Stepney of Jewish working folk left school at the age of thirteen. His plays include *The Hamlet of Stepney Green* 1958 (P), *Good bye World* 1959, *Change for the Angel* 1960, *The Dream of Peter Mann* 1960 (P), the one act *Stray Cats and Empty Beds* and *Enter Solly Gold* 1962, chosen for performance in the provinces by Centie 42.

Kops is less successful with realism than with fantasy enlivened with the gaiety of local colour and frequent Jewish folk song.

Most of his plays are variations on a basic design—that of the idealistic dreamer hero with an uneasy relationship with his easy going mother who in some cases is courted by a suitor whom he dislikes. Eventually the hero realises that a devoted girl is his true mate. Kops plays thus draw nourishment from a deep emotional source that of the Oedipus-Hamlet myth on to which he grafts the happy ending of the fairy tale.

Social criticism especially of mass produced goods is often a secondary theme.

The attraction of the plays is their fairy tale charm and naïveté their uninhibited joyousness and the easy way in which the rhythm of dialogue flows into verse song and dance. Kops is like a Jewish J. M. Barrie with the significant difference that most of his heroes renounce their dream for reality.

The artistic tension between spontaneity of feeling and excellence of form has become so relaxed that dramatic intensity is often sacrificed. The plays are loosely constructed and the dialogue sometimes so naturalistic as to be banal.

D H Lawrence (1885-1930) See also M7

It is remarkable that the plays of Lawrence should have had to wait half a century before coming to the stage.

In 1965 at the Royal Court Peter Gill directed Lawrence's first play *A Collier's Friday Night* (P) written in 1906. He followed it in 1967 with *The Daughter in Law* (P) and in 1968 he restaged these two together with *The Widowing of Mrs Holroyd* (P) in a special Lawrence season acclaimed by the critics.

These plays written before the First World War depict Lawrence's Nottinghamshire mining community with faithful realism. The themes are the universals already familiar through the contemporary *Sons and Lovers*—sex antagonism, the wife who feels superior to her minor husband, her possessiveness of the gifted son and jealousy of his wife or sweetheart.

Events of heart and home with profound emotional implications, move forward with a leisurely naturalism that is undisturbed by a forced plot and that seems extraordinarily modern in its idiom.

Henry Livings (b 1929)

The protagonist of Livings' frank and realistic comedies of working life is normally the little man whose unforeseen reactions culminate in hilarious disaster which topples down the petty rulers. Farce and near fantasy are lightly used to suggest a plea for the disregarded people who support the social edifice.

Slop It Whoever You Are 1960 P

The insignificant Perkin Warbeck, a lavatory attendant in a factory is involved in a series of ludicrous mishaps, but indirectly gets his own back on his harsh and frigid wife and his mean pompous landlord. The comedy which is very funny indeed culminates in a fantasy like scene of Warbeck's death a séance, and a gas explosion.

Big Soft Nello, or the Sacred Nt

A farcical comedy has a prot gonist a mother boy who is the laughing stock of his mates

Val Corbion idun 1962 P

The scene is the kitchen of an P A F station and the action culminates in a riotously funny meal commendo raid which exposes both the ruffian cook and service routine that he now in an chronism

Lt 196- M

In an ultra modern factory the incompetent young boiler man Val (David Warner) brings his bride to sleep in the bottom bunk and gives most of his attention to growing giant mushrooms and eventually blows the place to smithereens. Again a light hearted farcical comedy shows the underdog confounding established authority. In dently a fool's lapse starts the mushroom cloud

Honour and Other 1969 M

The pompous lodger and mortgagee Cash secretly desires his delicious landlady and her needy and unscrupulous husband a shifty travelling salesman who eventually fools him

Robert Lowell (b 1917) *See also M28*

The first dramatic work of the distinguished American poet Robert Lowell is *The Old Ghri* a recent trilogy of plays in free verse based on stories of Hawthorne and Melville. Their unifying motif is the flag

Benito Cereno 1967

The third and best play of Lowell's trilogy is based on a short story by Herman Melville which had its origin in actual incident

About the year 1800 while off Trinidad Delano Captain of an American trader observes that a Spanish trader the *San Domingo* is in great difficulties and generously goes to her aid

Captained ostensibly by Benito Cereno the *San Domingo* is in fact in the hands of her cargo of revolted slaves who have spared his life only that he may navigate them back to Africa. The effete and exhausted Cereno lives at the knife point at the hands of Babu the wily and insinuating Negro who is in actual command

Delano fails to realise thus for Cereno dare not speak plainly and the American is too opaque and self assured to interpret ironic hints. Only when Babu openly defies him is he enlightened but too late. The only safe course now left to him is open violence and without warning his seamen massacre all the Negroes

In a final ominous incident the last survivor Babu cries out. The future is with us before Delano empties his pistol into the Negro's body crying. This is your future

This is one of the most truly poetic plays to be seen in London for many years. Lured in verse rich in themes and suggestive power. austere in design while the theatrical poetry of mimes rituals and masques is used with ironic significance. The Director Jonathan Miller envisaged it as a kind of inverted *Tempest* the Spanish ship a black magic island and Cereno a drugged Prospero held captive by Babu and he produced it in the formal and stylised manner of opera.

The play is also remarkable in its relevance to America's dilemma, domestic and foreign, including her ambiguous attitude to the contemporary Negro. Jonathan Miller points out that Lowell here shows the penalties of unformed generosity and of the trilogy as a whole he says

These plays are about the big hearted blindness of the American nation and they show quite clearly how the country's cardinal virtues can harden into the very vices which so disable the American pursuit

In a world increasingly threatened by discord between white and coloured peoples *Benito Cereno* has an even wider implication

Peter Luke

Hadrian the Seventh 1967 P

The play derives from a novel by Polke (alias Coriol) an extraordinary autobiographical fantasy of his own which fulfils where the rejected hero Pose becomes Pope. Luke wisely identifies Pose with Polke and presents the elevation to the Papacy as a dream astonishingly spectacular and witty within the shabby frame work of Rolfe's own circumstances

John McGrath (b 1935)

Of Irish extraction McGrath who had wide experience in the army before reading English at Oxford has now had several plays published

Even's while Guarding the Bofors Gun 1966 M

In situation McGrath's masculine and disciplined play is a realistic counterpart of Giles Cooper's radio fantasy *Muthry Beacon*

The futility of military routine is exposed with sly irony as on a freezing night in Germany during the Cold War seven men guard the obsolete Bofors gun. The frustrating situation of engenders personal conflict. The uncontrollable desperado O'Rourke defies Lance Bombardier Evans. An insecure boy of 19 Evans is so obsessed by the hope that promotion may provide him a way of escape to England that he connives at insubordination. Finally O'Rourke's reckless suicide destroys them both

Balle's Night of Fame 1968

A play faithfully based on the novel *A Danish Gambit* by William Butler takes as subject the prisoner's last night in the condemned cell of an American prison

Balkie condemned for an apparently motiveless murder enjoys being as provocative as possible discomforting the well meaning guard by first requesting then contemptuously rejecting the traditional routine of food and consolation. He entangles the priest with his contention that society is exercising not justice but revenge. his only constant demand being that he shall meet his buddy the executioner

This granted Balkie so needles and infuriates the executioner that the man is betrayed into a violent outburst gloating over his imminent task. Balkie gleeful and triumphant has proved his point about revenge

McGrath shows great ingenuity and expertise in manoeuvre and sudden surprise but he has not quite achieved the tension and suspense nor the progression of the *Bofors Gun*. The significant encounter with the executioner comes too late and is treated too briefly

Frank Marcus

The best known plays are *The Killing of Sister George* 1965 and *Mrs Mousse Are You Within?* 1968. Both give a humorously sympathetic account of an unusual human relationship offset by bolsterous comedy coming from off-stage

David Mercer (b 1928)

Since 1961 Mercer has written television plays and also the film script *Morgan* or *A Suitable Case for Treatment*. His first stage play *Ride a Cock Horse* was produced in 1965. He is concerned with the psychological predicament of today's able educated young man of artisan origin (a reflection of his own situation as son of a Yorkshire engine driver). He usually depicts him as estranged from his parents disorientated and childless

Originally drawn to Marxism Mercer has recently said that whatever the society he is examining whether the Vatican or the Kremlin he is most concerned with the individual who's catching the muck that's flying off the ideological fan but he has not yet successfully dramatised this concern on the stage

Belcher's Luck 1966

The rickety English class structure is the frame work of a complex play

On his ramshackle country estate contemptuously served by his former batman Belcher Sir Gerald is becoming senile. Helen, his icy, malicious niece persuades Belcher to goid her uncle to his death so that they may together inherit the property. She then scornfully dismisses Belcher in favour of Victor his bastard son.

Victor, expensively educated by Sir Gerald, is mentally unstable and impotent but this familiar Mercer figure is now on the periphery. The conflict between the chaste and physically timid Sir Gerald and the coarse and drunken Belcher has become the compelling focus.

After Haggerty 1970 M

Bernard Link, dejected after two unsuccessful marriages, suddenly finds his new flat invaded by the vociferous American Claire, deserted wife of the former tenant Haggerty. She brings her baby, falseybrass decorators from Rely On, and to the comic confusion.

Meanwhile rather stereotyped flashback in the form of monologue reveal emotional stalemate. Bernard, international drama critic, addresses his parochial engine driver father (invisible to the audience) and the adoring heiress Claire talks to the indifferent and anarchical Haggerty (also unseen).

Bernard's weary embarrassment is intensified by the unheralded arrival of his father, prejudiced and censorious yet pathetic.

The play ends with two acts of cruelty. An empty coffin arrives from Haggerty, indicating his demise, and Bernard, exasperated by his father's mental atrophy, symbolically hangs the funeral wreath round his neck.

A latent topic is disillusion with communism and violent protest, but Mercer's favourite theme, the alienation of artisan father and educated son, finds no resolution. The dialogue is vigorous and inventive, especially in invective.

Flint 1970 M

The play presents the improbable situation of a kindly septuagenarian Kensington vicar, Flint (Michael Hordern), agnostic since ordination, whose sexual obsessions and irregularities have long been the scandal of the diocese.

While conducting his latest affair in the vestry with the teen age Dixie, a Liverpool Irish scrubber from Holloway gaol, already pregnant by another Flint, inadvertently sets the vestry on fire. Meanwhile his wife, hysterically crippled since her honeymoon, sets fire to the church. She is then murdered by her sister, formerly Flint's mistress, who promptly goes mad. Flint and Dixie escape abroad on his motor bike and side car. While she is in labour by the roadside, he helplessly crashes into an ammunition lorry and is killed.

Mercer has claimed that Flint's humanity is more valuable and more deserving of our love and compassion than the institution to which he belongs.

But to contrast the hero presented as endearing with some stagey clerics is unconvincing demonstration. Recent revivals of Shaw make Flint look paltry as a play of ideas, especially as the individuals who catch the monk 'are the vicar's hapless women'.

There is melodrama in plenty and some lively farcical comedy, but wordy meditations, virtually monologues, clog the action so that the play lacks the pace and invention of the sparkling Feydeau farces recently translated by Mortimer.

Arthur Miller (b 1915)

Arthur Miller, an admirer of Ibsen, shares his strong sense of moral purpose and of the individual's responsibility to the community. This is balanced by a sympathetic understanding of the insecurity of the individual in modern society.

Miller's characters, deeply felt and realised, are fallible men who suffer through their own errors of character or judgment in social conditions which are incomprehensible, indifferent or even hostile to them.

A recurrent pattern is that of paternal responsibility within a patriarchal family unit and the father's distress as he sees his errors hurting wife and sons. But the sense of responsibility flows

outwards to society as a whole of which the family is but the growing point. Significantly—apart from the benign mother figures—Miller's most balanced characters are lawyers.

His plays are well constructed, the dialogue economic and telling, and he has progressed from the realism of *All My Sons* published 1947 to much freer experimental techniques while the prose style has become more fluid and eloquent.

Death of a Salesman Published 1949 P

A compassionate and finely balanced play exposes the impingement of hire purchase commercialism on the ageing salesman Willy Loman, a weak, foolish and deeply affectionate man, and also reveals his overwhelming sense of guilt towards wife and sons. The play is worked out on two planes, the inexorable present and Willy's past, which obsessively enacts itself within his mind. The film version with Frederick March is excellent.

The Crucible Published 1953 P

In 1499 Marion Starkey's *The Devil in Massachusetts* dealt with a witch hunt in Salem in 1692 and pointed out its relevance to our own age, also rent by ideological intensities. In 1952 the activities of McCarthy gave it a special urgency.

In his powerful play Miller uses this historical incident to depict not an indifferent society but one in which positive evil is unleashed. The evils he explores are the persecution of a minority and the interference of the Establishment in the individual conscience.

Characteristically Miller focuses attention on the plain man, John Proctor, and he treats his former adultery with Abigail so that the play is not a partisan manifesto but a study of the complex contradictions of actual life. The self-righteous fanaticism of the persecutors and Proctor's own growth in self knowledge and courage are faithfully and poignantly portrayed.

A View From the Bridge 1956 P

Eddie Carbone, a Brooklyn dockworker, is so gripped by jealous possessiveness of his wife's niece that he eventually betrays her two kinsmen, illegal immigrants, to the Authorities. In a play of repressed sexual passion with hints of incest and homosexuality, Miller shows mastery of a kind of situation new to him and the heightening tension is realised in taut and disciplined sequences.

A lawyer, Alfieri, acts as a Greek chorus but is powerless to intervene for Eddie infringes some thing more primitive than the legal code and it is by the primitive vendetta that he is eventually killed.

Incident at Vichy 1966 P

Miller here turns to the responsibility of society for the individual in a play which exposes the latent racial hostility which even the best men may unconsciously harbour.

The example he takes is antisemitism, the place and time Vichy in 1942, the scene a bleak ante room within sound of a railway where sealed trucks are deporting Jews to the furnaces of Auschwitz. Here a group of men and a boy, Jewish suspects, await investigation. There is an atmosphere of chill horror and suspense as each tries to summon up his own pitiful defence against the premonition of the ghastly journey he must embark on once he is summoned behind the closed door.

Eventually only two men remain, the two most aware and articulate, Doctor Leduc, a Jewish analyst (Anthony Quayle) and Von Berg (Alec Guinness), the only Gentile of the group, a cultured and humane Viennese Prince who is horrified by the vulgarity and barbarism of the Nazis.

In their final dialogue Doctor Leduc convinces the Prince of his unconscious antisemitism and the Prince gives his safe conduct to the doctor.

A subsidiary theme of the play is the way society imposes extrinsically an identity on the individual. In this instance as in Frisch's *Andorra* the rôle of victim on the Jewish people. Through

Leduc Miller also criticises the Jews acceptance of their rôle

This disturbing play makes the greatest demands on the emotions: intelligence and humanity of the audience who like the Prince to some degree undergo psycho analysis. But the play is also characterised by a fine restraint. As in *Agamemnon* the violence takes place behind closed doors with the significant difference that in Miller's play the chorus and victims are identical

The Price 1969

Two brothers confront each other in an attic crowded with the heavy furniture of their dead father a financier ruined in the Depression. Its imminent sale is the occasion of their first encounter in sixteen years

Victor Franz who had given up a scientific career to support his father is now a policeman at retiring age but too immobilised by his past to begin a new career in spite of the hysterical pressure of his wife. Walter a surgeon in his sleek pursuit of success has had a prolonged breakdown and a broken marriage. The price ostensibly that of the furniture is the price each has paid for his decision in life and its inexorable results

The brothers ruthlessly dissect and probe back to the motivation of their choice. Walter is forced to admit calculated callousness but drives Victor to realise that his sense of social responsibility was also flawed for he had sentimentally sacrificed his potentiality to a disingenuous father too cowardly to work again

But no reconciliation ensues. Victor angrily refusing the dubious job which Walter offers as a salve to conscience

Miller describes his play as stripped to the skeletal structure of two lives the home the dead husk from which they had developed. But the characters are complex and through the Ibsen-like situation runs a thread of delightful and significant comedy. Solomon an ancient Jew survivor of wildly differing professions and four marriages is the furniture appraiser and embodies the resilience lacking in the Franks. When he falls he bounces. He shrewdly decides to buy all the furniture at a fair price and at certain fall sits gleefully in the chair of the beaten father chuckling exuberantly at his decision to begin life afresh

The play is realistic but the muted significance of various remnants of brief lives is symbolic in effect. Organised with meticulous artistry it is lucid and profound and rich in the wisdom of experience distilled. Acted without a break it holds the audience absorbed

John Mortimer (b 1923)

Mortimer a barrister first won success with his short plays such as *The Dock Brief* 1967 and *Lunch Hour* 1960 (M) originally written for radio and television

Here his talents are seen at their best especially his gift for seizing on an unusual encounter between the lonely neglected the unsuccessful, whom he envisages in realistic settings of shabby gentility and he is particularly sympathetic to those who allow their fantasy to overlap or swamp actuality

But the moment of insight that gives pathos to his short plays is not enough to illuminate those of full length like *What Shall We Tell Caroline?* and *The Wrong Side of the Park* which lack substance

Two Stars for Comfort (1960 M) is also unsatisfactory. In its basic situation it is an inflated version of *Collect Your Hand Baggage* (M) with little beyond sentiment and pseudo-Laurentian special pleading to fill the gaps

The Judge 1967 M

After 40 years absence from his native city, the bachelor Mr Justice Chard returns for his last assault. He seems to expect some unspecified accusation about Serena's Bohemian establishment but when the judge finally confronts Serena there he demands condemnation of himself

It is revealed that as a youth he had once had

relations with her knowing her to be a minor had subsequently paid for an abortion and that his whole life had been slowly undermined by a rankling sense of crime and inconsistency. When Serena tells him that there was no occasion for an abortion and that she got the money from him to go abroad with her lover the bewildered and frustrated Chard goes berserk

The plot is thus an inversion of Dürrenmatt's *The Trial*. The commanding themes of guilt and the difficult and exhausting process of judging are boldly focused in the complex compulsive personality of Chard. Balancing the themes of guilt and retribution is that of permissiveness represented by Serena. She is unfortunately pictured in a superficial way as a shallow Bohemian and her marriage is not unlike that satirised by Mrozek in *Tango* and much of the potential tension of the play is therefore slackened. Is the author too indulgent to his off beat characters?

In the scenes with the judge Mortimer returns to the milieu of *The Dock Brief* and much of the attraction of the play is in his witty attitude fascinated tolerant and amused to the cerebral names and quiddities of the legal process

A Journey From My Father 1970

An autobiographical play affectionately centred on Mortimer's own father also a barrister. Blinded by a minor accident, Father became increasingly eccentric his oddities often proving very disconcerting to his small rather isolated family circle

It is now apparent that Mortimer's own boyhood and schooldays and his father's idiosyncracies and fascination with the law have all helped to give substance to the earlier plays. Chard in *The Judge* especially shares with Father several mannerisms and also a liking for young people

Slawomir Mrozek (b 1930)

Mrozek a Pole who began as journalist and cartoonist has recently established a reputation for satirical short stories and short plays

Tango 1966 P

Mrozek's first full length play is like a satirical cartoon an expressionistic exposure of the cultural and political vicissitudes of 20th century Europe as liberalism fascism and communism succeed one another

A slovenly household of ageing Bohemians sentimentally cherish their memories of youthful rebellion against social convention when just to dance the tango was an act of defiance

The son Arthur detesting their sloppy anarchy of taste and morals enlists his reactionary great uncle Eugene in his own counter revolution to restore the *status quo*. But he soon resorts to fascist rant and force terrorising the family until he is himself cut down by his own henchman the tough lout Eddie. The curtain falls as Eddie forces Eugene to partner him in a tango

To an English audience especially the flatness of characterisation incidental to the cartoon style may be a little unsatisfying but the novel satire is exhilarating

Peter Nichols

A Day in the Death of Joe Egg 1967 F

Nichols has shown remarkable sensitivity and skill in developing his theme—the especial difficulties of monogamy when the only child a ten year-old girl is hopelessly spastic. He uses comic techniques of revue as the parents re-enact their frustrating encounters with doctors and clergy. But below the jesting facade grows the realisation that the wife a compulsive maternity blinds her to her husband's needs and that his endurance is crumbling

Nichols has a spastic child and says 'It's a play about marriage. Not autobiographical'

The National Health 1969 F

In a bleak men's ward in a decaying hospital the staff are normally competent but faceless. Interpolated are brief T.V. scenes of *Nurse Norton* s

Affair a burlesque of the rosy view of the medical profession as seen on popular TV.

The wickets of the consultant the chaplain and the visitor have the pungency of revue. The ward orderly acts as compere to the whole and also as devil's advocate who maliciously destroys the beginning of a positive relationship between a neurotic but protective schoolmaster and the alcoholic he is helping.

The play has the sharp precision and comedy of partial truth.

Eugene O'Neill (1888-1953)

Although O'Neill's work belongs to the first half of the century, three of his later works had their delayed premiere here in the fifties, two of them making a great impression.

Recognised as the greatest and most influential of American playwrights, O'Neill at his best came to close grips with the serious issues of human life, showing man battling with a harsh environment and with his own inner passions. He was deeply involved with his characters, often the flotsam and jetsam of humanity, conceived with disillusioned compassion and he could create the powerful theatrical situation which rivets the audience. On the stage these gifts went far to compensate for a looseness of structure and a dialogue which is singularly flat, poor in vocabulary and lacking in rhythm. His plays are better acted than read.

O'Neill lacking the advantage of an American dramatic tradition, experimented with many European techniques before finding his own most personal style—a faithful realism with suggestive overtones of emotion and reflection.

British playwrights like Wesker and Alun Owen resemble O'Neill. They also are committed to individuals, especially to working people living insecurely. Like him they reveal the subtle and inhibiting ties that bind members of a family or gang, subjects which lend themselves to a similar rather sprawling and diffuse structure and dialect style. So far they have not matched O'Neill's passionate and gripping intensity.

The Iceman Cometh Published 1947

In a naturalistic play whose prototype is Gorky's *The Lower Depths* down and out await the arrival of the Dionysus Hickey. But Hickey has just murdered his wife and his abortive attempt to rouse them from pipe dreams to reality leaves them sunk even more deeply than before in drink and self-deceit. The pessimistic theme is that of Ibsen's *The Wild Duck* and the situation that of Beckett's *Waiting for Godot*.

Long Day's Journey Into Night Published 1955

An avowed autobiographical play depicts O'Neill's family on the day when his mother (Gwen Ffrangcon Davies) relapses into drug addiction and Eugene learns that he must leave the doomed circle for a sanatorium. As it was there that he chose his vocation this constitutes the one note of hope in a deeply mournful reverie. The Freudian love-hate relationships are unfolded with tender understanding.

Joe Orton (1933-67)

Orton was a successful commercial exponent of black comedy who also won praise from serious critics especially for his dialogue.

His range is narrow and he is preoccupied with crime, perverted sexuality and violence portrayed without inhibition as hilariously comic, sometimes with satiric effect. The macabre plots give occasion for a flow of deadpan repartee, normally snappy, sometimes merely facetious, often very apt and funny indeed, always a parody of the would-be genteel. Nearly all Orton's characters speak alike and are as undifferentiated in their lingo as in their lack of morality.

The satire is in the form of caricature or parody and apart from its implications it is almost impossible to discover in Orton any expression of human value or aspiration. It is not always easy to discriminate between the unsavoury matter of his plays and the expertise and aplomb with which it is manipulated, and some feel that he defaces the image of life.

Intervening M. Sloane 1964 P

The handsome young wastrel Sloane already a murderer finds a cosy refuge with Kath, a slattern of forty, she smothers him with motherliness and sexually insatiable she seduces him from the first night. Her brother Ed, a homosexual, soon employs Sloane as his chauffeur. When Sloane tries to escape their possessiveness his brutal murder of their father puts him into their power and they agree quite literally to share him each having him for six months at a time.

The play scores by a skilfully handled plot, an ironic poetic justice and the sly and genteel euphemisms of the salacious dialogue and it won the London Critics' Variety Award as the best play of 1964.

Basically the plot is that of Pinter's *The Birthday Party*. In both cases a man on the run is sheltered by a slovenly older woman, but here Kath's sexuality vulgarises the situation and as she constantly refers to herself as Sloane's mamma and to their unborn child as his brother, it is highly suggestive of incest. The kindly husband of Pinter's play has been replaced by the homosexual smart Alec Ed.

Loot 1966 M P

Helped by his accomplice, a young criminal, secures the loot from a burglary in his mother's coffin. This is the key situation in a macabre and complicated farce which is also an exuberant caricature of funeral ritual of a police which is represented as ham-handed and venal and of cheap detective fiction. The characters are cardboard puppets manipulated by the plot and the play is notable for the fact that vice is completely triumphant.

Crimes of Passion 1967 M

A double bill consists of *The Ruffian on the Stair* 1966 Orton's first play and *The Lying Ham Camp* 1967. Frequent and fussy scene changes betray their origin in radio and television respectively.

The Ruffian on the Stair 1967 M

It is illuminating to see how Orton's first play a grotesque and savage comedy uses the plot but not the atmosphere of Pinter's first play *The Room* (q.v.). Orton cuts any aura of mystery and makes all explicit. The occupants of the room are now Mike, a criminal living with an ex-prostitute Joyce. The intruder is a boy, ostensibly seeking revenge for his brother with whom he had lived in homosexual incest and whom Mike had murdered. He is in fact seeking his own death and provokes Mike to murder him by pretending that he has seduced Joyce.

The Erpingham Camp 1967 M

A satire on holiday camps shows an uprising of the merry-makers who eventually kill Erpingham. The ebullient parody has some highly comic incidents.

It was first projected as a film script, a modern version of Euripides' *The Bacchae* but was rejected by Lindsay Anderson. Euripides' great play with Freudian foresight shows Pentheus destroyed by revellers because he had repressed the liberating worship of Dionysus (See H123). Orton's sketch completely lacks any such insight or complexity and Erpingham meets his fate simply because he is stupid and dictatorial.

What the Butler Saw 1969 M

A farce in a psychiatric clinic is typically Orton in its discrepancy between decorous speech and indecent behaviour, but pace and invention flag.

John Osborne (b 1929)

Osborne has considerable theatrical talent, torrential eloquence and the journalist's flair for seizing the mood of his own generation.

All these gifts were evident in *Look Back in Anger* 1956 (F) now well filmed and too familiar.

to need description. It was perfectly timed and it succeeds immediately. The protagonist Jimmy Porter voiced the pent up feelings of contemporary youth especially of the classes newly educated now baffled by the complicity of the privileged classes who had muddled through two wars and left them without sense of security or direction. The play's pervasive mood of self pity and strident denunciation runs with some variation through much of Osborne's later work although with the passing of years it seems increasingly subjective and irrelevant to the current situation.

In his major plays *A Patriot for Me* excepted Osborne keeps to the same basic pattern of characterisation and structure. In Jimmy Porter he created an unforgettable character a myth. But Jimmy with some change of occupation and age is constantly reappearing disaffected disorganised by self pity articulate and dominating. Archie Rice and Bill Matland are older but they also are Marxists figures driven on by sadomasochistic urges to destroy themselves and their circle and it is difficult to escape the impression that the typical Osborne protagonist is not presented with complete objectivity but serves in some degree as mouthpiece of the author. Osborne's minor characters are sketched in a perfunctory rather stagey way serving chiefly as audience or target to the protagonist and there is little dramatic confrontation of equals.

Closely linked with the structure of the plays is the nature of the dialogue. Osborne's forte is rhetoric the thinly disguised monologue splendidly uninhibited with some of the mebration and excitement of the pub and with the same coarse and bawdy jests. Sometimes it is a tirade of invective sometimes shrill and hysterical always commanding always flowing exclusively from the protagonist. Minor characters are given little opportunity for repartee or discussion their rôle being for the most part to act as feed.

Osborne's plays cannot legitimately be defended as satire for in comparison with the masterpieces of Ibsen and Shaw they express merely negative hostility and are not based on any clear concept of the values that should be realised in a good society.

There aren't any good brave causes left says Jimmy Porter. Neither here nor in any other play is there anything to suggest that Osborne does not endorse this destructive statement one of the silliest of the century.

His invective is moreover too general in discriminate and direct to be effective. His weapon is the bludgeon of sarcasm seldom the rapier of irony. Some notable exceptions are to be found in *Luther* where the targets are limited and specific and the speech where Tetzel sells indulgences is finely ironic. In this play Osborne has learned from the intelligence of Luther and the process of history. He is too emotional and subjective a writer to excel in art which demands disciplined thought and detachment.

The sameness in structure and tone in Osborne's work is cleverly mitigated by experiment in theatrical techniques. The realism of the garret scene in *Look Back in Anger* was in 1956 strikingly original. In *The Entertainer* and *Luther* he profited by the example of Brecht and *Under Plain Cover* was influenced by Genet.

The Entertainer 1957 F

Osborne here attempts to use the Brechtian device of distancing employing a framework of music hall scenes where Archie Rice (Olivier) a seedy comedian tries to hold the stage with tawdry patter and songs in a dubious show with nudes called Rock n Roll New d Look. These are intended to distance realistic scenes of Archie's shabby home. But the distancing device serves little purpose for the overall mood of unquestioned disillusion whooped up by drunk and patter is in both planes unrelieved. Querulous complaint that England has lost the glory and glamour of Edwardian days is crystallised on the realistic plane by the report of the death of Archie's son at Suez and in the music hall by the presentation of a nude Britannia wearing only her helmet.

Osborne turns to the music hall because he

claims it to be a folk art with an immediate direct contact. The film version is good.

Luther 1961 F

Luther based on a recent biography is a less subjective work although Osborne again takes for his hero a rebel the son of an unsympathetic mother and emphasises the emotional and not the intellectual sources of Luther's protests.

The play is imitative of Brecht's *Galileo* both in its loose epic structure and also in the attempt to present the protagonist in an equivocal light. The first two acts give a sympathetic and leisurely portrayal of Luther's early conflicts of conscience and vigorous attack on superstition while in the third act he is hurriedly presented as having treacherously let down the peasants who had been encouraged to rise against the Emperor. But the political reasons for Luther's dilemma are not even hinted at and we are invited not to think as in *Galileo* but to condemn while ignorant of relevant facts. Structurally this sudden *volte face* is most damaging to the play.

The most effective scenes such as Tetzel's selling of indulgences and Martin's sermon at Wittenberg are splendid rhetoric without a word of dialogue and directed straight at the audience.

Skilful period production and the acting of Albert Finney as Luther made the play theatrically effective.

Two Plays for England 1962

Two slight plays make a double bill.

The Blood of the Bambergs is a parody of a royal wedding. Monarchy is held up to ridicule along with its trappings of ceremonial and fulsome adulation by press and radio. The bridegroom having just been killed in his racing car an Australian press photographer is secretly passed off in his place. The final act is a film with an understated running commentary the film device deriving from the German Expressionist theatre where it was first used by Ernst Toller.

Under Plain Cover is intended as an attack on sensationalism in the press. The first part shows a pretty provincial couple dressing up in rôles symbolic of sex fantasy their activities accompanied by a thin trickle of dialogue. In the second half dramatic presentation is abandoned in favour of a charade and commentary by a reporter who reveals that the couple were brother and sister, a feeble presentation of the compelling theme of incest. The first scene is a pallid imitation of the brothel scene in Genet's *The Balcony* where the assuming of symbolic rôles has powerful sexual and political implications lacking in Osborne's play.

These sketches do not profess to offer convincing studies of character in action and unlike intelligent satire they do not imply positive standards nor use the mature techniques of irony and wit but rely on parody and mimicry.

Inadmissible Evidence 1964 F

A play which many have praised highly has the ingredients of a commercial success. It provides the sensational spectacle of a middle aged solicitor Bill Matland, obsessed with sex, and disintegrating under the influence of drink and drugs and thereby such a rôle for the star actor (Nicol Williamson) as to constitute a stage *tour de force*.

The play opens with a dream sequence as Matland is tried in the court of his own mind. What follows is his rancid outpouring of self pity as during forty eight hours he is progressively deserted by staff clients and mistress. Some of the minor characters are here reduced to unheard voices on the telephone and one actress serves to impersonate three faceless clients. Matland's flagellation of himself and his circumstances is unrelieved and monotonous.

A Patriot for Me 1965

The protagonist of Osborne's best play produced privately is Red a distinguished army officer of the Austro-Hungarian Empire who through his homosexuality is blackmailed into becoming a spy for Tsarist Russia.

Osborne is here finely objective and ironic. He uses a series of brief scenes with significant juxtaposition of characters and swift dialogue. The first act showing Redl's gradual discovery of his nature is extremely discriminating and adroit and the drag ball which opens Act Two is an astonishing *tour de force*.

Act Three shows a decline of tension as Redl now a spy himself declines his fibre coarsened through a sequence of sordid infidelities by male lovers and prostitutes. His final unmasking and suicide is almost a foregone conclusion.

The play spans the years 1890-1913 and Osborne presents the ethos and atmosphere of the Imperial Army officer élite undermined by espionage and treachery in a vast and unforgettable panorama.

A Bond Honoured 1966

Osborne in a free translation of *La Fianza Salsicha* is said to have distorted Lope de Vega's play and portraits yet another alienated and narcissistic hero.

Time Present 1968 F

The protagonist Pamela is a neurotic actress emotionally strangled by the familiar Electra complex, an exaggerated devotion to her father, a once famous actor now dying off stage she is unable to establish any satisfactory human relationship in spite of love affairs and the friendship of the devoted Constance, a successful Labour M.P. in whose flat she is living.

Pamela's role is static and verbal reiteration of her shallow scheme of values (a preference for style over vulgarity), sentimental reminiscences of her father and a relentless spate of contemptuous and indiscriminate derision. Phrased in modish argot some gibes have a bitter wit especially pleasing to the prejudices of the illiberal.

A contrived plot is superimposed. The exposition is clumsy, the climax Pamela's decision to have an abortion to end her pregnancy by Constance's own lover.

Pamela's alienation which should arouse compassion becomes tiresome rather than moving largely because of the play's apparent assumption that her outpourings have objective value and interest.

The Hotel in Amsterdam 1968 F

United by fear and dislike of their employer a film matee cryptically referred to as K.L. three couples retreat to a luxury hotel in Amsterdam as a hide-out from his encroachments.

They pass the weekend in denouncing K.L. drinking and exchanging desultory jokes and complaints about homosexuals, mothers and the working class until the unwelcome arrival of a relative and the news that K.L. has killed himself disturb the tenuous camaraderie.

Such a structure is perfunctory. Only the garrulous and petulant Laurie (Scofield) is individualised and the characters reveal and discover little of value about themselves or each other.

An interesting sidelight is that Laurie fancies himself as an authority on the creative process, boasting 'What I do I get out of the air. Is this Osborne's method? Great creative geniuses give a very different account.'

Since the play indicates no positive norm it cannot be defended as satire. Some critics praised it highly for its sense of mood. Others found it tedious.

Alexander Ostrovsky (1823-86)

The eminent Russian playwright is unfortunately little known in this country.

The Storm 1966

Written in 1859 Ostrovsky's fine realistic play portrays a social group unfamiliar to us, the petty tradesmen of an isolated township who are avaricious, ignorant, and bigoted.

The widow Kabanovna is a warped and ruthless matriarch who saps the vitality of her weak son and cruelly tyrannises over his hapless wife,

Katerina. The lonely susceptible girl yields to the love of a young stranger from Moscow. Then sheltering in a church during a violent storm she is overcome by superstitious dread and remorse. She confesses and later kills herself.

This perceptive tragedy is that of young and sensitive people striving to escape the yoke of rigid elders but in the last resort succumbing to the harsh creed by which they have been indoctrinated.

Alun Owen (b 1926)

Of Welsh stock, but with an Irish mother Alun Owen spent his youth in Liverpool.

His most characteristic style is the new naturalism nostalgically used to evoke the local colour of Liverpool. He seizes on its idiomatic dialects and the conflict implicit in the clash of race and religion while the ambition of the youngsters ambition to get away to sea or to London gives a wider horizon to a parochial scene.

Progress to the Park 1959 P

This is a leisurely enquiry into the affinities and animosities of Liverpool working folk, especially of a group of four young men and a girl as they eddy about in street, pub and park. The clash of race and religion is always just below the surface and what thread of story there is concerns the crossing of young love by parental prejudice. The most lively character is the voluble Welsh Telfon, mouthpiece of Owen's views.

The Rough and Ready Lot 1959

A carefully constructed historical play concerns four mercenary officers in a revolutionary army in South America just after the American Civil War. In a different milieu religious strife is again the theme. The convictions of an Irish Catholic clash violently with those of a Welsh militant atheist as to whether they shall shell a Catholic monastery which blocks the pass. Eventually both men are killed together with the vacillating English colonel and it is the simple and ordinary man Kelly who takes command the conflict of belief still unresolved.

There'll Be Some Changes Made 1969

In a lively first act a Negress vigorously rouses the tearful Valerie, just betrayed by her first lover to plan a tough revenge on the male sex. The play later loses momentum.

Harold Pinter (b 1930)

Pinter formerly an actor is now considered as one of the leading playwrights of the Theatre of the Absurd. He exerts an almost hypnotic power over his audience for he has an assured theatrical expertise, an uncanny sense of the novel situation and the telling pause and as his plays find resolution in some final surprise they are aesthetically satisfying.

His art has developed swiftly and two main phases can now be distinguished. The early plays culminating in *The Caretaker* in 1960 were concerned with the underprivileged and showed a growing sense of compassion and only a passing interest in sex. More recently Pinter has explored new ground. The plays have been much concerned with sexual experience, the background has usually been sophisticated and the attitude detached, sometimes to the point of apparent indifference.

Whatever the subject Pinter's plays have a certain poetic resonance, an imaginative absurdity. His power is probably due to his intuitive awareness of man's sub-conscious life and most of his plays present a dream-like sequence of events half credible, half absurd. In the early plays the dream drifts into a familiar nightmare of the most primitive kind—that of the violent invasion of personal security—a fear that must have assailed man's stone-age ancestor as he lurked in the squalid shelter of his cave, terrified of wild beasts and the inexplicable catastrophes of nature. Many of Pinter's later plays are still dream-like, fantasies of sexual anxiety and gratification especially as to marital fidelity.

The situation that first fascinated him was that of a room a door and two people. He has said: 'Obviously they are scared of what is outside the room. The danger that breaks in on them is both comic and shocking, but bizarre as the predicament may be the play is anchored in actual experience. I think it is impossible, he says —and certainly for me—to start writing a play from any kind of abstract idea. I start writing a play from an image of a situation and a couple of characters involved and these people always remain for me quite real.'

But his basic situation is so novel and striking that like poetry it can be interpreted on more than one level both as a revelation of those periods of intense private anxiety when the individual is all but distraught, holds on precariously to some tiny foothold, and also as an image of the predicament of the whole human race whose existence is threatened by ungovernable forces. Like Kafka whom he admires Pinter expresses vividly the 'feeling of insurmountable menace from some vague hinterland invading humdrum human existence'. *The Birthday Party* in particular has much in common with Kafka's *The Trial*.

In his first three plays the threat is left deliberately unexplained so that an aura of mystery surrounds the action and violence actually breaks through but in *The Caretaker* there develops a more subtle menace from within threatening the mind rather than the body and there is no overt violence.

The theme of uncertainty has persisted through out. In his first play *The Room*, 1957 he mystified his audience by contradictory information about insignificant details. This trick served perhaps to heighten the atmosphere of insecurity but some critics found it irritating and in later plays *The Collection* for instance we find instead a highly significant uncertainty as to people's veracity and motives. Pinter has explicitly stated that impression conveys a truer picture of our experience. The desire for verification is understandable, he says, but cannot always be satisfied and he points out that it is particularly difficult to be precise about people's inner life and motives especially if they are malicious. He consistently rejects the rôle of the omniscient playwright like Ibsen and looks at his characters through the eyes of the ordinary observer frequently puzzled by human inconsistencies.

A related theme has been the ambiguous nature of personal identity treated with increasing insight from the puzzle as to who Riley may be in *The Room* to the paths of masked personality in *The Caretaker* and the possibility of divided personality in *The Lover*. Some of the disturbing fascination that Pinter exerts is due to the state of uncertainty in which he leaves his audience.

As a playwright of the Absurd Pinter is closest in feeling to Beckett and he shares with Ionesco an awareness of the way that comedy interlocks with tragedy. Everything is funny says Pinter, the greatest earnestness is funny even tragedy is funny. And I think what I try to do in my plays is to get to this recognised reality of the absurdity of what we do and how we behave and how we speak. Occasionally like Ionesco he uses stage furniture to heighten the absurdity and both playwrights have a quick ear for the absurd clichés and non sequiturs of everyday speech.

Pinter is a stylist in the use of stage dialogue, an expert in cockney dialect. It is talk rather than dialogue that he records what Martin Buber has described as monologue disguised as dialogue, for his characters talk at people rather than to them. They rarely listen or respond, each bolstering up his self confidence in an intermittent monologue spiced with empty boasting. This is particularly appropriate to the confused and defeated people he portrays who even in their defensive jargon shrink from human contact.

Although Pinter's dialogue appears on the surface to be little more than a tape recording of casual talk there is beneath the demotic prose a poetic rhythm more compelling than the carefully calculated verse rhythms of T. S. Eliot.

Esslin's study *The Peopled Wound* 1970 is recommended.

The Room 1957 M

Pinter's first play written in four days for the drama department of Bristol University is already characteristic. Rose left alone at night is nervously aware of the door of her dingy room especially when a blind Negro Riley enters with a message from her father. Her husband on his return savagely kills Riley and Rose goes blind.

The murder of Riley possibly a rather clumsy death symbol is melodramatic but the lit room is a vivid dramatic image of man's tiny area of comfort in an indifferent universe.

The Dumb Waiter written 1957 produced 1960 M and P

In one act Ben and Gus hired as assassins working for some mysterious organisation anxiously await their unknown victim in a basement room in Birmingham. The clattering descent of a mechanical Ionesco like dumb waiter increases their anxiety until it is revealed that the victim is Gus himself. Situation and dialogue are both comic and taut with menace. The trite phraseology as the killers mention the senior partner, the job and clearing up ironically uses a business jargon. The tiny play is a microcosm of a treacherous world where violence can suddenly break up man's apparent alliances.

The Birthday Party 1958 M.

In Pinter's first full length play the room is in a shabby boarding house kept by the motherly Meg. Here Stanley who claims to have been a concert pianist has taken refuge until he is suddenly unnerved by the arrival of a sinister pair the specious Goldberg and the brutal McCann who like Gus and Ben are there to do a job. They subject Stanley to a fantastic catechism a parody of brain washing and during his phoney and ludicrous birthday party he is blindfolded and his glasses broken—symbolic of destruction of vision. Next morning the pair lead Stanley away conventionally dressed in black jacket and striped trousers incapable of speech his personality disintegrated.

The menace here is economically sustained through indirect means and the fact that the identity of the three main characters is never revealed adds to the terror. Some see Stanley as the political refugee some since he was a pianist as the artist who is made to conform by the pressure of society. But by his deliberate lack of definiteness the play has wide reference to all who seek refuge from a strange and hostile world.

The Caretaker 1960 M.

The play is set in a junk filled room where the kindly Aston lives in his brother's derelict house. He brings home an old tramp Davies who grudgingly agrees to stay as caretaker and then tries to encroach further by playing off one brother against the other until finally rejected by both.

In a naturalistic background Pinter has created two unforgettable characters presented in psychological depth with reference to their past and has depicted their failure to come to terms with compassion and restraint.

Davies is one who bites the hand that feeds him. His very identity is suspect for he passes under an assumed name having left his papers years ago at Sidcup. But he never retrieves them, like Beckett's Krapp repressing part of his past. Aston haltingly tells Davies how he once had periods of unique lucidity now destroyed by a terrifying shock treatment he was subjected to in mental hospital but Davies only reaction is later to threaten him. It is remarkable that when Aston finally rejects Davies' last encroachment the plight of the tramp should seem as pitiful as Aston's own, Pinter having wisely rejected his first intention to end the play with the violent death of Davies.

This mature play shows a man actually opening the door to his fears and mastering them. Aston in his long speech faces the wrong done to him by people. His unique vision destroyed his only creative outlet has been tinkering with his hands but as he tries to break out of his isolation

by befriending another crippled human being he unhappily meets a man so twisted by his own suffering and resentment that he cannot respond. Some find in Aston a moving image of the mystic and artist in man whose creative insight is destroyed by an imperceptive and mechanical society. The film is excellent.

A Starch Ache 1961 M

A short play shows an elderly couple haunted by a match seller who stands speechless at their gate. Eventually the wife takes him into the home instead of the husband. Possibly the silent match seller represents the unconscious desires of the wife and the anxieties of the husband.

A Night Out 1961 M

This compassionate and realistic brief play shows the clerk Albert trying one night to escape from the retarding domination of his nagging and self-righteous mother. After threatening her violently he himself finds himself in the room of a prostitute who proves equally peevish and would be genteel. It is doubtful whether Albert's violent gestures have won him any independence.

The Collection 1962 M

In an assured comedy of manners Pinter makes authentic use of mystification. Did Stella in fact sleep with a stranger Bill in Leeds? She tells James her husband that he did so but during the course of the friendship that develops between the two men Bill gives three contradictory accounts of what is supposed to have occurred while Harry an older man who has given Bill a home becomes increasingly jealous of James.

Ironically Stella's story told perhaps to pique her husband impels him away from her to male society and the changing partners has the elegant formality and economy of a dance movement.

Pinterian violence is here only lightly indicated.

The Lover 1962 M

An arresting short play shows the husband (Alan Badel) and the wife (Vivien Merchant) first as affectionate but distant partners and then with provocative change of clothes as erotic lovers. The performance of symbolic rôles including dressing up in fetish garments had already been used by Genet. Pinter cleverly adapts the device to discriminate between the apparently incompatible strands in the marriage relationship, a distinction analogous to that between Aphrodite Urania and Aphrodite Pandemos.

The Homecoming 1965 M

Teddy (Michael Bryant) a Doctor of Philosophy in an American University brings his wife Ruth (Vivien Merchant) on a surprise visit to his former home in North London where Max (Paul Rogers) his widowed father still lives with his two younger sons Lenny and Joey. It is gradually revealed that Ruth before her marriage had been a model and the family decide to keep her as their common mistress while Lenny a pimp arranges that she shall earn her keep as a prostitute. The plot is underlined by Lenny's brazen anecdotes of sexual brutality—a counterpart to the more undifferentiated violence of the earlier plays.

Because this is all presented with clinical detachment the audience is induced to suspend emotion. Only at the last moment is this cool acceptance shattered by an outburst of human feeling when Max aged 70 crawls sobbing to Ruth asking to be kissed and the audience is shocked into feeling the degradation involved.

On the surface the play is a disillusioned glance at life. It would be ridiculous to maintain that what we know merits reverence, says Lenny. It may also be interpreted as a fantasy of sexual gratification which in a dream state escapes the taboo of ethical and humane feeling and can be indulged in without demerit. The use of some accepted sex symbols and the slow and trance like acting especially that of Ruth is dream like in

its effect and the final shock of degradation is analogous to waking up and realising what the dream has implied.

It is possible also to see in Teddy an acquiescent Hamlet. He returns home from a foreign university to find marital infidelity for it is disclosed that his mother had been unfaithful with an uncle figure. Ruth is the counterpart of Ophelia who was bidden by Hamlet. Get thee to a nunnery —(an Elizabethan cant term for brothel) Teddy is like Hamlet also in that he prefers to operate on things and not in things.

The Homecoming is professionally brilliant but it lacks the depth of reference and emotional power of Pinter's earlier plays.

Landscape and Silence 1969 M

Beckett's influence is apparent in two short plays where inconclusive words and action are pared to the bone and whose theme is personal isolation. Both recall *Krapp's Last Tape* in their repetitive memories of past love.

Landscape originally broadcast is set in the kitchen of a country house where the middle aged caretaker appears to be telling his wife (Peggy Ashcroft) of the day's commonplace events and recalls an infidelity. She absorbed in dreaming of a tender encounter on the sea shore—possibly with him when younger—ignores him.

Silence is even more spare and brief although it took Pinter longer to write than any other play. Ellen sits between two men. Both have loved her in vain although she has all but forgotten them. They are almost immobile their only speech interlarded fragmentary memories of love. These are redolent of the country mostly at night fall. The men are family characterised. Bates the younger remembers the market a brothel. Rumsey his own house. Setting is discarded in favour of three areas. In comparison with *Krapp's Last Tape Silence* is like three simultaneous and hesitant tape recordings running in a void.

The Tea Party and The Basement 1970

Two plays originally seen on television were perfectly suited to the medium of film since both make swift transitions from objective happenings to subjective fantasies. They were however translated as faithfully as possible to the stage. Both involve the theme of encroachment on personal territory.

The Basement written first, is like a chic version of *The Caretaker*. A fastidious bachelor Law (Donald Pleasence) welcomes to his flat an old friend Stott who brings his girl friend. Both promptly take possession even of the host's bed. Law alternates between friendly chat and suppressed fantasies such as romantic seduction of the girl and violent duelling with Stott. The play suddenly concludes with rôles reversed. Law being the visitor demanding admittance.

The Tea Party centres on Disson a middle aged plump tycoon. Just before his marriage to a young woman socially his superior he engages a new secretary Wendy (Vivien Merchant) teasingly seductive with whom he is soon infatuated. His confusion increases when his patronising wife comes to the office as his secretary and when he suspects an incestuous liaison between her and her parasite brother.

Since wife secretary and even he as husband have each a curious distorted double Disson a visitor not surprisingly becomes confused. A single table tennis ball appears to him as two and he can only touch Wendy when blindfolded. His hysterical blindness culminates at an office tea party in complete loss of sight.

Poor Disson had from the outset been blind to his social position and his sexual needs.

Both in certain incidents and in the protagonist is a paranoia the play has echoes of *The Birthday Party* but now all on a fashionable level.

Terence Rattigan (b 1911)

Rattigan with his flair for light comedy is an expert in the well made play. His later more serious work includes *The Deep Blue Sea* 1952 and *Ross* 1962 about T. E. Lawrence.

A Bequest to the Nation 1970

A somewhat ornate historical play spans Nelson's final days in England. Like *Ross* it sympathetically probes intimate problems of a national hero. Its theme the conflict between Nelson's infatuation for Emma and his duty to which finally she generously yields. Pattigan cleverly uses Nelson's schoolboy nephew to emphasise duty to act as dramatic link with Lady Nelson and as the juvenile sensibility whereby Emma's tinsy decline is sharply focused.

David Rudkin

Afore Night Come 1962 P

In a Worcestershire orchard the fruit pickers enact the ritual murder of a freakish old tramp whom they dread as a threat to their virility. A realistic working day world is infused with the primitive terror of *The Golden Bough*.

Jean Paul Sartre (b 1905)

The plays of the French philosopher Sartre can be fully interpreted only in the light of his atheistic existentialist philosophy. Discarding conventional morality Sartre insists that the individual must evolve his own ethical code through daring freely to choose and act for him self. He must also will this freedom for others and by seeking to establish an interdependence of freedoms he engages or commits him self in the political struggle.

Sartre himself is a communist and his best plays like those of Brecht are fully committed to left wing ideology. They have sought to vindicate the inevitability of violence in the struggle for freedom and to decri the bourgeois morality which shrinks from such crime.

Sartre is also concerned with the absurdity of man's predicament as a rational creature in an illogical and indifferent universe but unlike Ionesco he presents the situation not through absurd images but through the medium of the traditional well made play.

Sartre has had a considerable influence on the climate of ideas encouraging an attitude of harsh disillusion and stimulating the current discussion as to whether or not drama should be a vehicle for social and political convictions. It is interesting to contrast the views of Wesker and Pinter on this issue.

Lucifer and the Lord Published 1951 P

The dilemma between non violence and force is here given greater universality by being projected back into the time of the Peasants Revolt in Germany. The brilliant General Goetz having failed in a policy of Christian love unflinchingly embraces a ruthless violence as the only possible realist social ethic.

Nekrassov Published 1956 P

A satirical farce ridicules the sensational anti communism of a section of the popular French press.

Altona Published 1956 P

This play showing a former Nazi officer going mad in an attempt to justify his own resort to torture in an attack on Western morality in its own recourse to torture used by French colonials in Algiers. The film version well reproduces the claustrophobic horror.

James Saunders (b 1925)

In Saunders early work the influence of Ionesco is apparent in the satirical use of a banal dialogue in which the characters converse without communicating and in the reference to some concrete symbol which represents their anxieties or predicament. His later work is reminiscent of Pirandello. Nevertheless Saunders ingenious plays have a freshness and vigour all their own.

Alas Poor Fred

In a one act play a friend who had some time ago been cut in half is the symbol of a married couple's former passionate love life long since sundered. The situation is like that of Ionesco's *Amédée*.

The Art 1959

In a more direct style this full length play of ideas re interprets the Old Testament story.

Ends and Echoes 1960

This is the general title for three clever one acters. In *Barnstable* the most amusing one a house is gradually collapsing around its unwitting inhabitants a symbol of the disintegration of their conventional way of life.

Not This is I'll Swag to You 1963

Based on Raleigh Trevelyan's book on the hermit of Canfield who died in 1942 this moving play uses the rehearsal style of Pirandello's *Six Characters*. Like an elegiac quintet it explores the theme of solitude.

A Scent of Flower 1964

Like the previous play this is a reconstruction of the past. It is gradually revealed that the character Zoe is in fact the spirit of a girl who has just committed suicide because her love for a married man is incompatible with her religion. The play proceeds by her touching encounters with the circle of relatives and friends to whom she had turned in vain for help.

Neighbours 1967

Neighbours was presented with another short play *Dutchman* (F) by Le Roi Jones. Both use an emotional encounter between a Negro and a white woman to focus the strain between the races.

A Negro invites himself into the flatlet of a young woman on the floor below. With some hesitation she entertains him. He then steadily challenges her enlightened liberalism as merely patronising and finally in what amounts to moral blackmail asks her to come and sleep with him. Confused and compassionate she yields.

The initial meeting is covered with much delicacy. Then as the Negro assumes the rôle of counsel for the prosecution a logical pattern is unconvincingly forced on the naturalistic material.

Peter Shaffer (b 1926)

Shaffer is an assured and ingenious dramatist whose first success was with the realistic well made play and who has since moved on to freer modes of composition.

His plays operate successfully on two levels: they offer insight into the subtleties of personal relationships especially into the difficulties of adjustment between people of different cultural background and they also involve discussion of ideas. The aesthetic problem of distinguishing between genuine love of art and snobbish pretension is a recurring theme often presented in a triangular situation.

Five Finger Exercise 1958 P

An alive realistic play shows Clive the young Cambridge student growing away from his stifling mother with her pretensions to modish culture but failing to make contact with his honest philistine father. The advent of an enigmatic stranger Walter acts as a catalyst. Mother and son are both attracted to Walter the father's fierce jealousy is aroused and Walter is narrowly saved from suicide.

Shaffer shows some of Ibsen's precision in his probing of a family situation where the members change and develop as they become painfully aware of their hidden drives.

The Private Ear and the Public Eye 1962

Two short and spare triangular plays both demonstrate the influence of artistic taste on the relationship between the sexes

The Private Ear

Bob, a shy music-lover asks Ted to help him enter into a girl whom he has met at a concert. But the ignorant girl is won by the complicitous Ted's vulgar patter and Bob left alone defecates his gramophone record and forces himself to listen to the broken music of love

The Public Eye

A witty ironic comedy shows Charles a correct and pompous dilettante unwarrantably jealous employing a private detective, Louis (Kenneth Williams) to spy on his wife. She becomes attracted to Louis because of their shared joy in things of beauty. With the entry of the neo-noelistic Louis a brilliant comic inventor force and tenderness go hand in hand with high comedy

The Royal Hunt of the Sun 1964

A sweeping epic drama of Pizarro's fantastic conquest of Peru skilfully uses as narrator, old Martin who waxes his own boyhood as page to Pizarro. Shaffer deploys total theatre in dazzling ceremonial processions and masks in ritual dancing, mime and strange metallic music. There is rich thematic material in the clash of two immense and joyless powers in the conflict of Christianity and Sun worship. Personal tragedy develops in the mutual attraction felt by the grizzled Pizarro (Colin Blakely) and the young Inca Atahuallpa (Robert Stephens). Captor and prisoner they painfully seek for the god in each other and the Inca accepts death both as a sacrifice to friendship and the final test of his faith

Black Comedy 1965

A highly successful brief comedy frankly uses an effective device of Chinese theatre. During a party the lights fail and the stage although supposed to be in darkness is still fully illuminated so that the ludicrous behaviour of the dramatic personae is visible only to the audience

The Battle of Shrivings 1970

The idealist Sir Gideon (Gielgud) whose home is Shrivings (suggestive of confession and penance) is an eminent philosopher. He is committed to belief in human perfectibility and pacifism and lives a celibate life with his unselfish wife Enid. With them resides David, son of Gideon's former pupil and friend Mark (Patrick Magee). Mark is a famous poet long expropriated who now visits Gideon on the occasion of their both receiving an Oxford award.

The life and ideas of the robust and cynical Mark who is now toying with Roman Catholicism have become the antithesis of Gideon's and he maliciously challenges his host to an extraordinary contest. He will return to humanism if what ever he may do Gideon can endure his presence for the weekend!

Mark then disillusioned Enid by revealing Gideon's homosexual past. He seduces the girl friend of his own son and cruelly pronounces him to be a bastard.

Both contestants win but both are broken. Gideon bitterly taunted by Enid is provoked to strike her and reduced to despair while Mark is attacked and beaten down by his son.

The play like Bolt's *The Tiger and the Horse* (1961) is an honourable attempt to dramatise philosophical and ethical problems especially the discrepancy between man's idealistic convictions and his personal relationships. But lengthy exposition and discussion delay the final action and the characters and plot are too schematic for an organic development.

The fact that the play appeared soon after the death of Bertrand Russell and recalls his friendships with writers such as D. H. Lawrence rather weakens its impact.

One Way Pendulum (b 1919)

N. F. Simpson's plays of the absurd are in the peculiarly English vein of Lewis Carroll and Edward Lear, a world of surrealist fantasy in a casual and nonsense. It is almost a contradiction in terms to organise such material coherently and to do so in a full length play is a tour de force which Simpson brought off in his *One Way Pendulum*. His best work ridicules the mechanical and conventional existence the attenuation of feeling of the little suburban home, his usual milieu.

The Resonance Triangle 1957 P. F.

A most unusual play which pokes fun at suburban life discards plot, progress and characterisation and the uniform dialogue is one continuous flow of clever verbal paradoxes and non sequiturs. The 'apologetic' author appears at intervals and in the final act there is a parody discussion of the play by a panel of critics—devices used by Ionesco in *The Shepherd's Chamber* on

Simpson's verbal agility is exhilarating but some of the play over cerebral. It is certainly at the opposite end of the spectrum from Ann Jellicoe's *The Sport of My Mad Mother*.

One Way Pendulum A Farce in a New Dimension 1959 F.

Here Simpson has devised a framework built of whimsy and yet firm enough to carry its own logic and to be dramatically satisfying. The characters are drawn simply but consistently each with his own humour in the manner of Ben Jonson and the dialogue is a close parody of banal family interchange.

The play concerns a suburban family the Groomkirkbys whose son Kirby is teaching a collection of weighing machines to sing the Hallelujah Chorus. His ineffectual father is combining his two favourite hobbies of law and do it yourself carpentry by building an enormous model of the Old Bailey in the living room where the phlegmatic mother passes a charwoman to eat up the left overs.

Finally a trial takes place in the Old Bailey and Kirby is convicted of murdering forty three people in order that he may wear black, the weighing machines being part of a complicated device to cause a holocaust of death.

The main theme of the play is the tyranny of things which is exemplified by the absurd Ionesco like objects. These are treated with the respect due to human beings while human beings are treated as things and father and son are so obsessed by things that they cannot get into touch with one another.

The tyranny of mechanical routine and social custom is also indicated. Kirby will only eat when a cash register rings and will only wear black when it is sanctioned by funeral convention.

The anxiety and guilt which result from a stunted and mechanical existence are finally symbolised in the nightmare parody of a trial scene in the final act.

Although the stage objects are novel and intriguing and can be assigned a clear meaning they lack the suggestive power of Ionesco's chairs or rhinoceroses. Contrived rather than intuitive they illustrate more than they illuminate the human condition. But the play is an original and successful experiment and the implied comment on the unconscious assumptions and compulsive habits of the Groomkirkbys has a wide reference.

The film version is recommended.

The Cresta Run 1965

A play about counter espionage proved disappointing partly because its mockery is directed at a schoolboy dream rather than at a general malaise partly because it lacks the bold structural outline of *One Way Pendulum*. Even the absurd objects—keys codes disguises—are trivial compared with the Old Bailey. Simpson has also lost some of the claustrophobic compulsion of his earlier plays by his constant switching of the

action from the home of the suburban couple to the Ministry and back again

It is unfortunate that a promising latent theme—the compulsion felt by the Security man to divulge his secret information—is swamped by trivia while the best jest is only a casual aside—the suggestion that in England Intelligence should logically be in the hands of private enterprise!

The Hole 1967 and *The Form* are one acters in the same style as the full length plays

Wole Soyinka (b 1934)

Soyinka a Nigerian and an English graduate is an admirer of Brecht Arden and Durrenmatt

The Road 1965

The Road set in a drivers' haven in Nigeria successfully produced with a large cast of coloured actors later won a Dakar award

The Lion and the Jewel 1966 OUP

In a lively comedy presented by the Iwale Company of African actors the jewel is Sidi the belle of a Yoruba village. Elated at being photographed for a glossy magazine she rejects both the native schoolmaster and the old chief, tain the Lion, until cunningly seduced by him she exultantly joins his harem.

Native culture with vivid ritual dance and music is presented as more alluring and virile than European which is mocked both in amusing mimes and in the shabby ineffective school master infatuated with Western gadgets

Tom Stoppard (b 1937)

Stoppard has written plays for radio including the engaging *Albert's Bridge* (F) and for television

Rosencrantz and Guildenstern are Dead 1966 F

Stoppard's diverting play is a gloss on *Hamlet* and he dovetails snatches of Shakespeare's tragedy with his own action or rather maction for his archetype is Beckett's *Waiting for Godot*

He humorously chooses as protagonists the two nonentities Rosencrantz and Guildenstern. Summoned inexplicably to Elmsmore they hang about always on the fringe of great events they do not understand, passing the time like Shakespearean jesters in witty word play and fruitless speculation as to their situation and destiny.

Their predicament is a suggestive image of the bewilderment of the ordinary man faced with world events beyond his grasp and at a deeper level with the existential problem of man's very being on this earth and the imminence of death.

The rehearsals of the Players the counterpart of the enactors of Pozzo and Lucky in *Godot* create a further film of unreality and illusion.

The play is too long the second act not sufficiently contrasted but it is remarkable that so derivative a play should be so delightfully fresh and original.

Enter a Free Man 1968 F

This comedy is an extended version of a television play of 1963. Reilly (Michael Hordern) a self-styled inventor of unworkable Heath Robinson gadgets leaves home regularly every Saturday to spend in the pub the ten shillings pocket money allowed him by his working daughter always to return home when his money has run out. His long suffering wife (Megs Jenkins) has consoled herself with the hope that if he is to be a failure anyhow he might as well fail at something he'd like to succeed at.

The situation although genuinely funny and pathetic is not adequate to a full length play.

The Real Inspector Hound 1968 F

This crisp and intelligent burlesque like Sheridan's *The Critic* uses the device of the play within the play. It is a simultaneous parody of faded theatrical convention and modish theatrical jargon.

Two critics are watching an absurd drawing room whodunit with a corpse ignored by all taking the centre of the stage. But the main focus of interest is the critics. Both are obsessed the introverted Moon only a stand-in for the jealous hatred of his professional superior the absent Higgs while the euphoric Birdfoot is always infatuated with the latest actress.

Then at the ringing of a stage telephone absurdity completely takes over. The call is from Birdfoot's suspicious wife! He is drawn off stage where he takes on the part of the tickle lover soon to be followed by Moon who told the stage corpse is that of Higgs. In a few minutes both critics in consequence of their private obsessions have been shot dead the sharp crack of retribution not unusual in Stoppard.

Beneath the glittering zany surface of the play lies the concept of drama as the mirror Hamlet's mirror up to nature wherein we see and identify ourselves with the dramatist's personae.

The play formed part of a double bill with Sean Patrick Vincent's musical satire *The Judson*. It appears that Stoppard's comic genius finds its best vehicle in the short play which his dazzling virtuoso invention can sustain to the end.

David Storey (b 1933)

Storey also a novelist is the son of a Yorkshire miner and helped to support himself at the Slade by playing professional Fugby for Leeds. He wrote the film script for his own novel *This Sporting Life* and Lindsay Anderson while directing it encouraged him to revise his discarded play *Arnold Middleton*.

Anderson has directed Storey's three subsequent plays and the imaginative rapport between producer and playwright has led to their being interpreted with singular insight and restraint.

One theme in Storey's work as in Mercer's is the stress felt by the educated offspring of working folk. His plays involve reference to mental trouble or instability and he is much interested in the theories of R. D. Laing.

The plays are grounded in every day life frequently in Storey's own experience. Yet they have become increasingly poetic in approach in that their significance is consciously ambiguous and escapes and refuses definition. Storey deliberately leaves all the options open. He also says that if on reading something through he knows completely what it is all about then it is dead, but if it mystifies him then it is taken on an independent life of its own.

No two plays are alike and this versatility is most promising.

The Restoration of Arnold Middleton 1967 P

Arnold a young schoolmaster (as Storey once was) is a jesting eccentric his latest acquisition an outside of armour introduced during the play's revision. But Arnold's clowning disguises the fact that he is going mad.

The theme is reminiscent of Mercer's *Morgan* with the gorilla suit but the exuberant comedy tends to blur the issue and the interpretation of the hero's instability and lightning recovery is inadequate.

In Celebration 1969

Three sons return home to celebrate the fortieth wedding anniversary of their parents, a dotting collier husband and complacent patriarch who considers herself his social superior.

With first-hand realism Storey conveys the disorientation and embarrassed filial feeling of sons educated beyond their origins. The eldest brother the iconoclastic Andrew is hell bent on tearing down the family facade and tries to force on stolid Colin and sensitive Steven his theory that their ambitious mother had distorted their lives into a false respectability to appease her own sense of guilt. When six months pregnant, she had felt obliged to marry the collier father and after the firstborn had died at the age of seven she had tried to commit suicide.

After an extravagant dinner at the local hotel Andrew lashes the bewildered father with his

scorn and only the concerted efforts of Colin and Steven can help to reassure the old man and get Andrew away next morning before he can confront the mother.

The psychological motivation is not fully credible but this compassionate and close knit play with the past haunting the present recalls Ibsen especially since Andrew is an ignoble counterpart of Gregers Werle in *The Wild Duck*.

The Contractor 1969

Five men leisurely assemble and later dismantle a huge tent for the wedding of the contractor's daughter while members of the family drift in and out. The workers banter and taunts and the family casual talk hint at hidden hurts but the focus of the play is the actual work on the tent—as in Ionesco a thing—presented here with no absurdity or phantasy but with almost the faithfulness of documentary for Storey can draw on his own experience of the job.

The image is however metaphorical and because he play cannot be confined to any one definition. Storey finds it one of his most satisfying works. He sometimes sees it as somehow related to the decline and falling away of capitalist society or as a metaphor for artistic creation. Yet it still continues to make sense—and complete sense—as the story of these men who put up this tent and that's that.

Home 1970

Sitting at a garden table on the only two chairs available two ageing gentlemen Jack (Ralph Richardson) and Harry (Gielgud) gently and diffidently make conversation. Jack slightly more dapper and prone to pointless family anecdote usually takes the initiative in their exchange of dated clichés and banalities. The broken phrases refer to wives now separated, ambitions unfulfilled, the clouds but real communication can only be unspoken and there is sad irony in Jack's. So are these days nowadays to meet someone to whom one can actually talk.

When these leave then places are taken by two rough Cor blimey women full of prurient innuendo and scandal and when the gentlemen return and courteously escort the ladies to corn beef hash it has gradually become apparent that this is a mental home. Act II begins with the entry of a leucotomised young man who aimlessly shifts the furniture about.

The play heart breaking in its naturalistic fidelity to human inadequacy is handicapped by some monotony of incident and dialogue. But like Beckett's *Godot* also a strange quintet it works through poetic suggestion. The ironic title and the furniture inadequate for 2000 people are significant as is the apparently irrelevant juxtaposition of phrases which are in themselves ambiguous metaphors. (This little island. Shan't see its like. Oh no. The sun has set. Couple of hours.)

But the decline of hope and vitality (perhaps that of England herself) is most potently expressed by the unadorned shape of the play, the decline of the day from morning to evening, the sky overcast the rain that of the old men's silent tears.

Cecil P Taylor

Taylor is quizzically interested in left wing types especially their inconsistencies and fallacies. He is very successful in a brisk brief comedy like *Allergy* 1966 (P). In *Bread and Butter* 1966 (P) his naturalistic outline biography of two Jewish couples in the Gorbals between 1931 and 1966 is sympathetically done but too slight to sustain the full length play.

Peter Terson (b 1932)

Terson is a prolific writer with a talent for fertile fluent dialogue which immediately establishes personalities and relationships. His most successful work has been done in active co-operation with two directors, Cheeseman and Croft.

In 1963 while working as a games master in the Vale of Evesham, Terson first contacted Cheeseman, director at Stoke-on-Trent whose policy it

is to find writers rather than plays and through his encouragement and suggestions Terson wrote several plays located in the Vale. A recurrent theme of these is the mysterious power of nature as opposed to urban sophistication and as in Rudin's *Afore Night Come* (q.v.) a sinister theme often runs through them. Cheeseman considers Terson's greatest gift is his capacity to write in a way that is both very funny and profoundly serious at the same time.

The Evesham plays include *A Night to Make the Angels Weep* 1963, *The Mighty Pesserooy* 1964, *I'm in Charge of These Ruins* 1966, *All Honour Mr Todd* 1966 and *Mooney and His Caravans* 1967 (P).

Terson became known nationally through his remarkable collaboration with Michael Croft, director of the N.Y.T. For *Zigger Zagger* (P) there was only a fragmentary script which was built up on stage by Terson Croft and the actors. Even *The Apprentices* (P) which began with a clear line of development was considerably modified during rehearsal when Terson feels stimulated by the reactions of director and actors.

He writes about youngsters with affectionate zest and exuberant humour vividly aware of the lack of opportunity offered by modern society to the younger school leaver.

Zigger Zagger 1967 (P)

Dominating the play is a remarkable manipulation of a youthful football crowd which acts as a living backdrop to the scene. Harry school leaver and near delinquent is so possessed by its Dionysiac frenzy that he is opaque to all efforts of authoritative figures such as the youth officer and respectable relatives to gear him into a job. Eventually grudgingly accepting life's economic demands he becomes an apprentice.

The Apprentices 1968 (P)

During mid day breaks in a factory yard crowded and animated as a Breughel overalled apprentices play football fight and wrangle. The flurried foreman and older hands caustic yet tolerant act as foil.

The chief personalities are vividly presented in the round. In the centre is the derisive irrepressible Bagley priding himself on his rebel's instinct kindly at heart yet an enthusiast for the barbarous initiation ritual. But the progress of events leaves him stranded. Led by the studious Geoff his fellows including Harry are gaining qualifications and getting on and out. The factory modernised will need brains not muscle and all have lost interest in the initiation. Bagley a married man at 18 his wife already pregnant after a brief holiday encounter ruefully drifts towards the older fitters he had despised.

Fuzz 1969

The crowd techniques of the N.Y.T. were again deployed in a lively dramatising of student protest movements but students own lack of a positive unifying purpose became reflected in the play in itself.

Spring Heeled Jack 1970

The setting for another N.Y.T. play now directed by Barrie Rutter is the rowdy yard of a crowded block of council flats. 'Lop' just back from prison for petty larceny finds scant sympathy from the noisy mixed population. He becomes suspected of murdering an old tramp and in the mounting hysteria he is identified with the mythical terrorist and voyeur Spring Heeled Jack. Only the intervention of a sympathetic Negro saves him.

The central momentum of the play tends to be dissipated in extraneous currents of action and farcical episodes.

Jose Triana (b 1931)

Triana born in Cuba spent four years in Madrid but returned to Cuba after Castro's revolution and has now written several plays.

The Criminals 1967

The first Cuban play staged here depicts three adults a brother and his two sisters acting out fantasies of childhood hatred of thwarting parents and the tyranny of home which culminate in a frenzied ritual of their murder of the parents at the end of Act One. The trial of the children in Act Two gradually develops into an enactment of the parents' mutual detestation. As the curtain falls the ritual begins afresh.

This intense play in the genre of Theatre of Cruelty (q.v.) has less wealth of imagery than Weiss's *Marat Sade*, but a greater universality of reference than Genet's world of criminals and pervers. It may have been influenced by the work of Arrabal.

Triana shows great psychological insight: children's play is often a dramatic projection of their inner anxieties and conflicts and at all ages the sterile process of fantasy gives only temporary relief and must be endlessly and exhaustingly repeated. The most significant moment of the play is when the word 'love' is timidly offered as an alternative only to be rejected.

An extremely apt parallel to Triana's vision was the contemporary Keith lecture (26 Nov. 1967) when Dr Leach the social anthropologist criticised our unthinking acceptance or the inward turning type of family life where 'The parents fight, the children rebel'. Of such a family Dr Leach said: 'The strain is greater than most of us can bear and he considered it to be the source of our social discontents'.

Triana's play effectively shows it as a potent source of man's aggression. Some critics have seen in it implications of Castro's resistance to the dominance of America.

Boris Vian (1920-59)

The French Vian was influenced by the Absurdist approach of Ionesco.

The Empire Builders 1962

Man's futile flight from death is imaged in a family trying to escape from a terrifying noise by moving up to a higher and higher floor and nearer quarters. Eventually the father alone reaches the attic where he dies.

The Generals Tea Party 1965 P

Written in 1951 Vian's biting absurdist satire on the military mentality represents his general behaving like a small boy afraid of Mama and asking his playfellows—other generals—to tea. After deciding that war would be a nice idea they then select the target—prophetically Algeria.

Roger Vitrac (1899-1952)

The French Vitrac an associate of Artaud attempted Surrealist plays which anticipate the Theatre of the Absurd.

Victor 1964

Victor is a boy of 9 but 7 foot tall and with a mature intelligence. He and his outside girl friend are the only rational beings in a farcical adult world.

Frank Wedekind (1864-1918)

The plays of the German Wedekind a passionate moralist are preoccupied with the mysterious power of sex and in their intensity they sporadically break through the bounds of realism into fantasy and symbolism—techniques later to be deployed although to different ends in Expressionism (q.v.).

Spring Awakening 1863

Published in 1891 the play which concerns the lyrical rapture and the agony of puberty is a fervid indictment of a disastrous and repressive morality of secretive or hypocritical parents and grotesquely tyrannical schoolmasters.

Finally in a scene of nightmare fantasy the

ruined adolescent Melchior searching for the grave of his sweetheart dead through an abortion is encountered by the ghost of his suicide friend and is himself only restrained from the same fate by the symbolic Man in the Mask.

Lulu 1970

Lulu is the title given by Peter Barnes to his adaptation of two plays *Earth Spirit* 1895 and its sequel *Pandora's Box* 1903. Barnes's version keeps to the basic substance if not to the spirit of the original.

Wedekind's protagonist Lulu the incarnation of the instinctual life symbolises sexual passion in its beauty rapture and terror in her narcissism and uninhibited passion she destroys all who become hopelessly infatuated with her unbridled erotic fantasy alternating with horror and the grotesque.

In Barnes's Act I corresponding to *Earth Spirit* Lulu causes the death of her first husband by shooting the suicide of the second and shoots the third Schon.

In Act II the sequel she gradually degenerates to amateur prostitute status adored by two ruined devotees a lesbian countess and Schon's son. To him she has been successively foster sister step mother and mistress the incarnation of a Freudian dream. These two also die and she herself assassinated by a pervert casual client Jack the Ripper.

Burnes's adaptation neglects the mystery and pathos of the original. The characters are presented flat. Only the countess and Schon's son are a little more than two dimensional and so excite some sympathy. Fantasy and horror are abruptly succeeded by grotesque bathos in the modish spirit of black comedy (q.v.).

Peter Weiss (b 1916)

The German speaking Weiss has adopted Jewish nationality and Marxist doctrine.

The Marat Sade 1964

The full title of this verse play: one of the most impressive exemplifications of Artaud's Theatre of Cruelty is *The Persecution and Assassination of Jean Paul Marat as Performed by the Inmates of the Asylum of Charenton under the Direction of the Marquis de Sade*. As the title indicates this complex work operates on several planes of cruelty thus exciting in the audience that vivid experience of violence which is the aim of Artaud.

Artaud's demand for primitive ritual which shall exorcise repressed fantasy is met by Corday's threefold visit and murder of Marat and also by the inmates' frenzied miming of the ceremony of the guillotine—a background motif to the whole play. The use of pantomime and gesticulation on the open stage satisfy Artaud's demands for spectacle for poetry in space.

Peter Brook pointed out that these elements are not consistent with a Brechtian alienation—achieved by the device of a play within a play—the protesting comments of the director of the asylum, the intellectual debates between Sade and Marat and the ribald songs of a grotesque quartet of zanyes. The effect is an inextricable blend of the comic and the violent.

The Investigation 1965

A documentary of the Frankfurt War Crime Trials edited by Weiss had a multiple premiere in East and West Germany and at the Aldwych. Described by Weiss as an Oratorio in 11 Cantos after Dante's *Inferno* it indicts the millions including the German monopoly capitalists, who tacitly supported the Nazi atrocities.

At the first impact the grisly facts leave an overwhelming impression of horror. It is remarkable that the author's restraint and dignity in presenting them and the formal austerity of his design have in retrospect the effect of catharsis.

The Song of the Lusitanian Boy 1969

A passionate indictment of Portuguese colonial exploitation and oppression of Angola recalls in

some of its techniques Peter Brook's *US*. It was splendidly acted by the New York Negro Ensemble.

Arnold Wesker (b 1932)

Wesker, son of a Jewish Hungarian father and a Russian mother, first became a chef and worked in Norwich, London and Paris before taking a 12 months course at the London School of Film Technique where he wrote his first play.

He is known not only as a dramatist but also as a devoted socialist. Since 1962 much of his time has been given to his efforts to bring an enjoyment of good drama and art to people who would otherwise lack opportunity. To this end he has founded—under the aegis of the Trade Unions—the well known Centre 42.

Wesker's early plays were in the naturalistic idiom, centred on the vivid portrayal of an East End Jewish family and a farm labourer's family in Norfolk. He evidently found naturalism inadequate and there gradually appeared in his work strains of Expressionism which in *Chips with Everything* became the dominant style. Wesker's hold on dramatic structure is erratic but he has an exhilarating sense of movement on the stage.

His most individual characteristic is his passionate concern for his characters. They are presented in the round, living, aspiring and erring so that they achieve an independent existence, especially the women. Although male protagonists like Ronnie Kahn and Pip are seen both in their strength and weakness, Wesker does not entirely detach himself from them, somehow conveying his personal reactions to them—a conflict of love and exasperation. He has nevertheless gone much further than Osborne for instance in creating a truly objective image as his more flexible dialogue indicates. He has a keen ear for social and personal idiosyncracies especially urban Jewish volubility and the fumbling speech of the country labourer.

Like Sartre, Wesker is deeply committed. He is a convinced socialist but not a propagandist for his plays explore the moral and practical difficulties of the socialist position and he shows unusual honesty in portraying Ronnie Kahn, the most vocal of socialists as a weak if not renegade personality.

The Trilogy—The trilogy consists of three naturalistic plays in which a discursive history of the Jewish family, the Kahns, is fused with political debate on the course of socialism.

***Chicken Soup with Barley* 1958 P**

This is the springboard of the trilogy. It opens on October 4, 1936, the morning of Mosley's attempted march through the East End of London when the curtain rises on the basement flat of the Kahns, a Jewish family dedicated to socialist activities. It is 1967 when the play ends with the disillusion of the son, Ronnie, at the Russian occupation of Hungary.

Each of the Kahns is a live human being presented not for moral judgment but with sympathy. Especially commanding is the mother, Sarah. What Jung might call an extraverted feeling type, she is ignorant of events, contemptuous of books, a strenuous mother figure and yet in her aggressive dynamic the most masculine person of the group in contrast to her amiable but shiftless husband, Harry and the vainglorious Ronnie.

The central theme of the play is the conflict between attitudes of mind: caring or concern for the welfare of others and indifference to it. The battle is fought on two fronts in the home and politically it being taken for granted that socialism is an expression of caring. The stalwart Sarah is the centre of the two fold conflict for she attacks both social inertia and that of her husband and son.

Structurally the play is sprawling but Wesker already shows his intuitive sense of theatrical movement. At the end of Scene I there is an exhilarating leap forward as the little band of fighters surges from the basement to the light. A more experienced dramatist might have placed

such a triumphant movement as the final climax but the general pattern of the play is of recoil and hesitancy held only by Sarah's unshakable faith in caring and Ronnie's honesty with himself.

***Poo's* 1959 P**

There is here a skilful shift of scene to Norfolk where Beatie Bryant (Joan Plowright), a farm labourer's daughter on holiday from London reveals her family. Beatie is engaged to Ronnie who has for three years been trying to educate her especially in the arts and in the intelligent use of words (the brides of communication). She has ignored his advice but endlessly parrots his sayings to her phlegmatic family.

Preoccupied with the primal necessities of life the Bryants are the coarse roots from which Beatie has sprung. In spite of a rough friendliness they are immanent prejudiced stubborn and above all maritulate.

When on the day appointed for his visit Ronnie sends instead a letter saying their marriage would not work. Beatie is at last galvanised by shock into finding thoughts and words of her own. These folk she realises are without spiritual roots or standards. Then comes her ecstatic moment of self-realisation. She is at last thinking and speaking for herself.

Although he does not know it Ronnie has realised his ambition to save someone from the fire.

The play is well constructed, the characters and dialogue are convincing, Beatie delightful. The ideas discussed about roots and bridges develop organically from the situation.

***I'm Talking about Jerusalem* 1960 P**

In 1946 the Kahns' daughter and her husband Dave settle in Norfolk to put into practice the theories of William Morris but Dave finding that his hand made furniture cannot compete economically with the factory product faces their failure and in 1959 they return to London.

The theme of disillusion is here fully analysed by the volatile Kahns but the mood escapes despair and Dave's self respect and sober appraisal of unpalatable facts is contrasted with the embittered cynicism of a friend.

The play is weak structurally. There is insufficient action and Dave is not a sufficiently commanding figure to hold things together. Then the intimate study of tender family relationships suitable to a novel is embarrassing except for brief moments on the public stage.

Two symbolic moments in Act II indicate that Wesker was realising the limitations of realism. One is the miming of a simple ritual of reconciliation, the other a ritual enactment of the story of creation.

The Trilogy as a Whole—Wesker's trilogy throws up vital questions of good and evil, both personal and social, the chief perhaps being that of heredity. Must Ronnie and Beatie inherit their parents' limitations? Is Mrs Bryant right when she says:

The apple don't fall far from the tree? Is man foredoomed and his struggle vain? Ironically it is the undependable Harry who suggests that giving people some love may help them to change while of socialism he says: If it purify itself. Who was right and in what degree?

***The Kitchen* 1959 P**

In a two acter Wesker draws on his experience as a chef to give a vivid impression of a day in the kitchen of Marango's restaurant. The play is notable for its skilful contrasts in pace and movement. The quiet morning quickens to a frenzy of anxiety at lunch time and the doldrums of the afternoon are succeeded by the sudden outburst of a German who goes berserk.

The swirling vortex is an image of the blind activity of society and while avoiding the rigidity of allegory, Wesker clearly indicates that the kitchen is a microcosm of the world, where men with their casual contacts find themselves in a situation beyond their grasp. The play ends with the dramatic irony of Marango's failure to per-

ceive that work and food alone cannot satisfy man's desires

Although it destroyed the claustrophobic atmosphere the film version caught very well the movement of the play

Chips with Everything 1962 P

In *RUR* (*Possum's Unusual Robots*) the Expressionist playwright Karel Capek used robots as dramatic personae. In *Chips with Everything* Wesker brilliantly deploys Expressionism to illustrate the process whereby military discipline can reduce individuals to a robot like uniformity both the complacency of authority and the inertia of the ranks

A squad of nine R & P conscripts is subjected to a battery of bullying abuse from the corporal and psychological manipulation by the commissioned officers until their personal identity submerged they learn to move as one mechanical unit and pass out to the blaring of a military band playing God Save the Queen.

Expressionism is particularly appropriate to his purpose. He uses type characters to represent social forces—the best example being Corporal Hill—and the identity of the recruits is with two exceptions indicated very lightly. The dialogue is for the most part staccato while brief stylised, symbolic scenes such as the square bashing and bayonet practice succeed one another rapidly a triumphant instance of Wesker's innate command of stage movement

As to the two recruits presented in greater detail the plight of the gentle Smiler broken and suffering is sufficiently generalised to give pathos and depth to the play without disturbing its tone but the predicament of Thompson is treated with too much psychological detail to be in key especially as the portrait is not entirely convincing

The son of a general, Thompson is at first resistant to authority and appears to be trying to assume leadership of the squad. But the habits of a class that can eat chips with everything are too distasteful for him and accused by the recruits of slumming and assailed by the blandishments of the officers he suddenly capitulates and assumes officer's uniform

The overall effect is tense and powerful and scenes of moving comedy such as the breath taking mime of stealing coke alternate with the where the audience facing the same direction as the recruits themselves cannot escape feeling the obliterating effects of the military machine

The Four Seasons 1965 P

The course of love through the four seasons of the year is traced through the shared experience of a man and woman whose previous marriage had foundered. Wesker has unsuccessfully applied an Expressionist style to unsuitable material a static situation without incident or plot

Their Very Own and Golden City 1966 P

The driving power of an unusual play is probably Wesker's own struggle to realise a communal and artistic ideal in Centre 42

He skillfully integrates a sweeping expressionistic panorama of social trends since 1926 with the creation of rounded idiosyncratic characters. The inspired architect Andrew Cobham, has a vision of the ideal city that shall set a pattern of living for the community but its full achievement is thwarted by obscurantist Trade Unions and by his accepting the patronage of a Tory Minister and a capitalist industrialist. Andrew's emotional life is split between frustrated friendship with an aristocratic girl and estrangement from Jessie, his homely wife

A vantage point is offered by recurring dream like scenes in Durham Cathedral. Acting as a flash forward they show Andrew the youth with his fellows and Jessie. Ecstatic with joy at the sublimity of the cathedral he envisages his own life-work. But the final scene in keeping with the disillusion and compromise that have blighted his vision serves as a sad ironic flash back.

The Friends 1970

Her brother lover and friends surround Esther's deathbed. Of Jewish working class origin they have become affluent and cultured but have lost direction. Disillusion as to the workers' capacity for culture is a theme adumbrated but not clarified. The situation is static and the dialogue often embarrassingly introverted and self conscious

John Whiting (1915-63)

John Whiting was an original playwright who was much preoccupied with the theme of self destruction but was slow to find his own style

A Penny for a Son 1961

Written at a time of great personal happiness, this is an agreeable whimsy depicting two eccentric brothers in their Dorsetshire residence preparing to repel the armies of Napoleon. The appearance on the stage of a balloon and a home made pea engine gave the authentic period touch of gentlemanly interest in scientific invention and impart to the farcical civil a dash of pantomime

Whiting cleverly gives a comic perspective to the recent fear of foreign invasion and so takes the sting out of terror

Son's Day 1961

This play written before *A Penny for a Son* won the award in a Festival of Britain Play competition

It concerns self destruction its central figure being the octogenarian Paul Southman once famous revolutionary poet who had long ago gone into self imposed exile because of popular outcry against his work

The plays opens well. Southman is a striking figure an embodiment of the angry artist at war with society and like Swift in his aggressive scorn or compromise his scurrilous style and final madness. His situation is at first sufficiently distanced to be convincing but when the fashionable young writer Procatathren introduces the glossy contemporary world it begins to seem implausible. Later Procatathren accidentally kills Paul's grand daughter Stella and then orders three deserting soldiers to hang Paul and Stella's husband also an artist and the initially powerful theme is swamped by melodrama.

The play generally is overloaded with half developed symbolism and allusion.

Marching Song 1954 P

In a play much concerned with the existentialist stress on the inescapability of choice Whiting returns to the theme of self destruction

The setting is generalised—a wealthy house above a capital city in Europe. Rupert Forster formerly a general, who seven years previously had inexplicably lost a decisive battle here meets his dilemma. He must either face a trial, which might cause political unrest or commit suicide. The choices are represented by two people

In Act II Forster encounters Dido a young woman who revives his sense of humanity and will to live. She represents the female side of personality the Jungian anima and her name recalls the Dido of the Aeneid who by her love deflected Aeneas from the path of military duty enclosed by fate

In Act III he has a very different meeting with Captain Bruno the embodiment of military ambition who represents the male aspect of personality. To him Forster at last confesses the cause of his fatal defeat. He had been so overawed with compassion for children whom he had destroyed while they were impeding his tanks that he had been unable to follow up his advance. Bruno stigmatises the delay as military error and guilt and Forster commits suicide rather than face disgrace and imprisonment

This is a strongly constructed play its dominating theme worked out with single minded austerity. But it lacks thrust and momentum. Forster's reversion to his original decision to commit suicide gives it a circular movement and

it is more concerned to clarify judgment of the past than to affect the future. In its acknowledgment of the discrepancy between military code and humane ethic it is highly topical and stimulating.

The Devils 1962 P

Suggested to Whiting by Peter Brook this intricate and distinguished play is based on Aldous Huxley's *The Devils of Loudun*, which treats of an actual case of suspected diabolism in France between 1623 and 1634.

Whiting employs two focal points. One is Grandier (Richard Johnson) again a man who invites his own destruction a worldly and sensual priest who is yet gifted with a rare religious insight and compassion. The other is a hunchbacked priestess (Dorothy Tutin). Although she has not met Grandier she becomes obsessed by fantasy of his amorous adventures and her resulting hysteria which spreads throughout the convent is suspected as diabolical possession instigated by Grandier. Richelieu for political reasons uses this as a pretext to get rid of him. Grandier in spite of excruciating torture and degradation the prelude to his being burnt alive struggles to retain his faith.

In its subject and theme *The Devils* is strikingly similar to Miller's *The Crucible*. Both plays show *l'homme moyen* ensnared accused of diabolism and beset by a woman's jealousy, irrational superstition and malignant spite yet still keeping his integrity in the face of death.

There are significant differences. Whiting's intricate play is not realistic but Brechtian in style with a series of brief episodes and a commentary by a sewerman whose ironic and sceptical remarks counterpoint Grandier's eloquence. It lacks Miller's reference to the contemporary scene and its final note is one of harsh pessimism as the sewerman tells the priestess that Grandier's bones are being prized by the crowd as superstitious charms.

The final act presents an almost unbearable spectacle of a barbarous ritual of physical torture as the maimed and twitching Grandier is paraded in public procession through the streets.

Tennessee Williams (b 1914)

The American Tennessee Williams is a playwright of great talent whose freely flowing naturalistic plays combine violence and melodrama with haunting portrayal of personality, fluent dialogue and original settings.

Of recent years the following major plays have been produced in Britain: *The Glass Menagerie* 1948 revived 1965 (P). *A Street Car Named Desire* 1949 (P). *The Rose Tattoo* (P). *Cat on a Hot Tin Roof* (P). *Camino Real* the least realistic play 1957 (P). *Suddenly Last Summer* (P). *Period of Adjustment* 1961 and *The Two Character Play* 1967.

Although his plays breathe the atmosphere of the Deep South—often decadent in tone—Williams unlike the extravagant Miller is preoccupied not with social issues but with the inner life of his characters. Compelled by their own passions and obsessions and caught in the web of family relationships they break away only at great cost and pain to themselves and others so that a mood of determined sombre but not altogether despairing broods over much of Williams work.

He portrays the vulnerability of those who desire or love anything intensely humanity's sense of guilt, defiant aggression and despair all of which he claims to find within himself. The violence characterising so much of his work reaches its climax in *Suddenly Last Summer*.

Especially poignant are Williams' penetrating psychological studies of life's pathetic failures: the crippled Laura retreating to her glass menagerie, Blanche Dubois of *Street Car* and the alcoholic Brick and his childless wife in the *Cat*.

The Two Character Play 1967

Like the early *The Glass Menagerie* the play treats of an ill-omened brother-sister relationship. Believing them to be mad the cast of a touring theatrical company have just deserted the two star actors a brother and sister, Felice and Clare. Alone on the stage the pair hysterically decide to

put on Felice's own work *The Two Character Play*. This play within the play is also about a brother and sister who stay immured in an overgrown house in their terror of facing the world outside. Their father had killed their mother and then committed suicide and people now suspect the brother-sister relationship. Whether it is the relationship of Felice and Clare or of the dramatic personae is left ambiguous in a Pirandello-like piece hovering on the confines of reality and illusion, sanity and madness.

Charles Wood (b 1932)

Ever since *Cockade* 1963 Wood's plays have been chiefly concerned with military life. An exception was *Till the Stage with Happy Hours* 1967 (P).

Dingo 1967 P

Wood employs Expressionism to present a phantasmagoria of the last War beginning in the desert and grinding through Stalag to the unconditional surrender of Germany. It is an assault on the emotions and sensations in a passionate attempt to bring home war's physical horror and spiritual attrition but Wood's specific concern is to expose latent jingoism and political expediency and the futility of the heroism they demand.

The scurrilous words matter less than certain persistent images: the ranker Dingo epitome of bitter disillusion. Tanky rendered simple minded because he was powerless to release his mate screaming to death in a flaming tank, an ENSA comedian who serves to parody Churchillian rhetoric and breezy morale boosting of High Command, a young subaltern dressed as a blonde in a bikini for a concert party designed to cover an escape from Stalag and now with Tanky rolling dead from the barbed wire.

The play is powerful but sprawling, cluttered on one side. It attacks the idea that Britain played a more disinterested rôle than in previous wars. It was fought not for others says Dingo but for all the usual reasons: an emotive statement that needs scrutiny.

H 1969 M.

Wood's subject is the heroic march of the elderly General Havelock or H during the Mutiny. His column vastly outnumbered and decimated by disease he yet relieved Cawnpore and won twelve desperate battles before relieving Lucknow where he died of dysentery.

A devoted and chivalrous Christian and a disciplined commander Havelock yet ordered some of the terrible reprisals then current hanging mutinous sepoy or shooting them alive from the mouths of cannon. His equivocal behaviour helps to resolve and focus Wood's own conflicting impulses, his fascination with military discipline and his horror at the bestiality of war so that the play is more unified than *Dingo*.

The core of the play is irony centred in the action of the protagonist. But the irony proliferates as in the contrast between the stylised Victorian language and the brutal deed and in the many brief unconnected episodes as for instance one recalling the mutual love and sacrifice between British and sepoy. These demanding a constant reorientation of attitude tend to distract and confuse.

The fact that Havelock's aide de camp is his own son suggests the tender perspective of home. Resolute in courage and obedience the son differs from his father in opinion and faith and his eventual confession of Christianity at Havelock's death gives pathos to the scene.

The Brechtian epic style is well suited to the simple episodic structure. Brechtian devices are also used—direct address to the audience, map titles and symbolic emblems such as the simple blood stained floor and awning arrestingly conveying the Indian atrocities at Cawnpore. Brechtian in spirit too is the deliberate theatricality of short scenes projected within a little replica of the popular travelling stage.

Although Havelock on the surface resembles the Brechtian ambiguous protagonist the chief weakness of the play is that he does not attain the commanding stature of a Galileo or a Mother Courage.

IDEAS & BELIEFS

This section explains many of the ideas and beliefs that have dominated men's minds during the centuries. The arrangement is alphabetical and the subjects fall broadly into three groups: religious, philosophical, and political.

IDEAS AND BELIEFS

This section explains many of the ideas and beliefs which people have held at different periods in history. Beliefs may be true or false, meaningful or totally meaningless regardless of the degree of conviction with which they are held. Since man has been moved to action so often by his beliefs they are worth serious study. The section throws a vivid light on human history.

Man has always felt a deep need for emotional security, a sense of belonging. This need has found expression in the framing of innumerable religious systems, nearly all of which have been concerned with man's relation to a divine ruling power. In the past people have been accustomed to think of their own religion as true and of all others as false. Latterly we have come to realise that in man a religious striving there is common ground for our need in the world today is a morality whereby human beings may live together in harmony.

There is also to be found in man an irresistible curiosity which demands an explanation of the world in which he finds himself. This urge to make the world intelligible takes him into the realm of science where the unknown is the constant challenge. Science is a creative process, always in the making, since the scientist's conjectures are constantly being submitted to severe critical tests. Basic scientific ideas are discussed in Section F.

In writing of beliefs, especially cherished beliefs and of how they fit into the modern picture of the world, it is difficult to avoid causing some offence, but the reader is assured that the writer has tried to be fair and helpful.

A

Aboedarians name (derived from A B C) of a small German religious sect founded by the Anabaptist Storch in 1522 who claimed that, as knowledge of the Scriptures was communicated directly by the Holy Spirit, it was wrong to learn to read. See Baptists.

Activists those in a political movement who insist on taking active steps towards their objectives rather than merely putting forward a programme.

Acupuncture a new medical cult originating in China and based on the supposedly therapeutic effect of implanting fine gold needles in the spinal column. Practices of this kind, which are of arguable scientific status, seem to flourish in parts of the world where orthodox medicine has made little progress or where doctors and trained staff are scarce. Nevertheless it is always worthwhile examining them, even if only to attempt to identify the presumably psychological basis of their effectiveness. In the case of acupuncture if any physical effect occurs it may be because the insertion of the needles has some anesthetic effect on the nerves which have been prodded.

Adlerian Psychology In 1911 the Viennese psychoanalyst Alfred Adler (1870-1937) together with his colleague Carl Gustav Jung broke with their friend Sigmund Freud over disputes concerning the latter's theoretic approach to psychoanalysis. Jung and Adler were themselves shortly also to part company each to set up and develop his own school of psychoanalysis. Adler's system of psychotherapy is based on the idea not of sex as a driving force as in the case of Freud, but on the concept of compensation, or a drive for power in an attempt to overcome the inferiority complex which he held to be universal in human beings. The child naturally feels inferior to adults but bullying makes him feel insignificant or guilty or contemptible, even spoiling which makes him feel important within the family but relatively unimportant outside increases this feeling. On the child may have physical defects he may be small or underweight, have to wear glasses, become lame, be constantly ill or stupid at school. In these ways he develops a sense of inferiority which for the rest of his life he develops a technique to overcome.

This may be done in several ways: he may try to become capable in the very respects in which he feels incompetent—hence many great orators have originally had speech defects; many painters poor eyesight; many musicians have been partially deaf. Like Nietzsche the weakling he may write about the superman, or like Sandow the strong man be born with poor health.

On the other hand he may overdo his attempt and overcompensate. Hence we have the bully who is really a coward, the small man who is self-assertive to an objectionable degree (Hitler, Napoleon, Stalin and Mussolini were all small men) or the foreigner who like three of these men wanted to be the hero of their adopted country—Hitler the Austrian, Napoleon the Italian, Stalin the Georgian.

But what about the man who can do none of these things who continues to fail to compensate? He says Adler becomes a neurotic because neurosis is an excuse which means I could have done so and so but...

It is the unconscious flight into illness—the desire to be ill. Thus a man who used to have a good job lost it through no fault of his own and developed a nervous breakdown, one of the symptoms of which was a fear of crossing streets. Adler would have asked: What purpose is served by this symptom? Why does he unconsciously not want to cross streets? The answer was that he had only been offered inferior jobs and although he felt for his family's sake that he ought to take them, something inside said: No I have been very important man and I cannot bear to do insignificant work. —If I am unable to cross streets I am unable (through no fault of my own) to go out to work. Adler's treatment involves disclosing these subterfuges we play on ourselves so that we can deal with the real situation in a more realistic way. The criticism of Adler's theory is not that it is not true. It is. But it is not the whole truth for people are much more subtle than Adler gave them credit for. Freud recognised this element of secondary gain in neurosis but he knew that there was more to it than that. Nevertheless Adler's method works well in some simpler cases. See also Psychoanalysis.

Adoptionism in Christianity a doctrine advanced at various times which holds that Jesus was not born divine but in virtue of his human spiritual achievements was designated by God as the Son of God at the moment of his baptism in the Jordan, as told in all the four Gospels. Among the sects who held this heretical doctrine were the Paulicians (q.v.). The Adoptionist view differs from the orthodox Conceptionist view only in regard to the moment in the life of Jesus when the incarnation took place.

Adventists a group of American religious sects, the most familiar being the Seventh Day Adventist Church which observes Saturday as the true Sabbath. With more than a million members throughout the world, it shares with other Adventists a belief in the imminent second coming of Christ (a doctrine fairly widespread in the U.S.A. during the early decades of the 19th cent. when the end of the world was predicted by William Miller for 1843, then for

1814) Modern Adventists content themselves with the conviction that the signs of the Advent are multiplying the blessed event which will solve the world's ills. Believers will be saved, but the sects differ as to whether the unjust will be tortured in hell annihilated or merely remain asleep eternally.

Agnosticism. See God and Man

Albigenses also known as Cathari. French 12th cent heretical sect (named after the town of Albi in France) who maintained that material things belonged to the realm of Satan and that salvation was to be achieved by crushing all animal instincts particularly the sexual instinct. Universal continence would end the domination of matter by the extinction of the human race. The eating of animal flesh was forbidden and vegetarianism enjoined in order to weaken the desires. Those who rigidly kept to these rules were initiated into the grade of the Perfect, those unable fully to comply were known as the Believers. Condemned as heretics by Pope Innocent III, the sect was finally exterminated in the Albigensian Crusade led by Simon de Montfort towards the end of the 12th cent. (In his thoroughness de Montfort also succeeded in destroying the high culture of the Troubadours.) See Manichaeism

Alchemy ancient art associated with magic and astrology in which modern chemistry has its roots. The earliest mention of alchemy comes from ancient Egypt but its later practitioners attributed its origins to such varied sources as the fallen angels of the Bible to Moses and Aaron but most commonly to Hermes Trismegistus often identified with the Egyptian god Thoth. whose knowledge of the divine art was handed down only to the sons of kings (cf the phrase hermetically sealed). Its main object was the transmutation of metals. Egyptian speculation concerning this reached its height during the 6th cent. in the Alexandrian school. Brought to Western Europe by the Moslems one of its most famous Arab exponents was Jabir (c. 760-815) known to the Latins as Geber who had a laboratory at Kufa on the Tigris. One school of early Greek philosophy held that there was ultimately only one elemental matter of which everything was composed. Such men as Albertus Magnus (1204-80) and Roger Bacon (1214-94) assumed that by removing impurities this *materia prima* could be obtained. Although Bacon's ideas were in many ways ahead of his time he firmly believed in the philosopher's stone which could turn base metals into gold and in an elixir of life which would give eternal youth. Modern science has of course shown in its researches into radioactivity the possibility of transmutation of certain elements but this phenomenon has little bearing on either the methods of the alchemist or the mysteries with which he surrounded them.

Anabaptists. See Baptists

Analytical Psychology the name given by Carl Gustav Jung (1875-1961) of Zürich to his system of psychology which like Adler's (see Adlerian psychology) took its origin from Freud's psychoanalysis from which both diverged in 1911. Briefly Jung differed from Freud (1) in believing that the latter had laid too much emphasis on the sexual drive as the basic one in man and replacing it with the concept of *libido* or life energy of which sex forms a part (2) in his theory of types: men are either extrovert or introvert (i.e. their interest is turned primarily outwards to the world or inwards to the self) and they apprehend experience in four main ways one or other of which is predominant in any given individual—sensing feeling thinking or intuiting (3) in his belief that the individual's unconscious mind contains not only repressed material which, as Freud maintained, was too unpleasant to be allowed into awareness but also faculties which had not been allowed to develop—e.g. the emotional side of the too rational man, the feminine side of the too masculine one (4) in the importance he attaches to the existence of a collective unconscious at a still deeper level which contains traces of ancient ways of thought which mankind has inherited over the centuries. These are the *archetypes* and include

vague primitive notions of magic spirits and witches' birth and death gods' virgin mothers' resurrection etc. In the treatment of neuroses Jung believed in the importance of (a) the present situation on which the patient refuses to face (b) the bringing together of conscious and unconscious and integrating them.

In the 1940s and 50s interest in Jung's ideas waned at least in academic circles as the emphasis among experimental psychologists shifted closer and closer to the hard scientific line. This was also true in the field of psychoanalysis where the Jungian as opposed to the Freudian point of view became progressively less popular. At the present time this trend is beginning to reverse and while Jung's offshoot views on astrology telepathy etc. are still unfashionable a reappraisal of the significance of his views on the nature of the unconscious is taking place and many psychologists feel that his contribution to our understanding of the nature of human mental processes has been greatly underrated. See also Psychoanalysis

Anarchism a political philosophy which holds in the words of the American anarchist Josiah Warren (1798-1874) an early follower of Robert Owen that every man should be his own government his own law his own church. The idea that governmental interference or even the mere existence of authority is inherently bad is as old as Zeno the Greek Stoic philosopher who believed that complex society perverts the normal nature of man. William Godwin's *Enquiry Concerning Political Justice* (1793) was the first systematic exposition of the doctrine. Godwin (father in law of Shelley) claimed that man is by nature sociable co-operative rational and good when given the choice to act freely that under such conditions men will form voluntary groups to work in complete social harmony. Such groups or communities would be based on equality of income no wage control no property; this state of affairs would be brought about by rational discussion and persuasion rather than by revolution.

The French economist Proudhon (1809-65) was the first to bring anarchism to the status of a mass movement. In his book *What is Property?* he stated bluntly that property is theft, and governments are the scourge of God. He urged the formation of co-operative credit banks where money could be had without interest and goods could be exchanged at cost value at a rate representing the hours of work needed to produce each commodity. Unlike Godwin he disapproved of violence but unlike Marx disapproved of trades unions as representing organised groups.

In communistic anarchism these ideas were combined with a revolutionary philosophy primarily by the Russians Michael Bakunin (1814-76) and Peter Kropotkin (1842-1921) who favoured training workers in the technique of direct action to overthrow the state by all possible means, including political assassination. In 1863 anarchists joined the First International which broke up a few years later after a bitter struggle between Bakuninists and Marxists. Subsequently small anarchist groups murdered such political figures as Tsar Alexander II of Russia, King Humbert of Italy, Presidents Carnot of France and MacKinley of America, and the Empress Elizabeth of Austria.

Anarchism and communism differ in three main ways (1) anarchism forms no political party rejects all relationship with established authority and regards democratic reform as a setback (2) communism is against capitalism anarchism against the state as such (3) both have the final goal of a classless society but anarchism rejects the idea of an intermediate period of socialist state control accepted by communism. Philosophical anarchists, such as the American writer Henry David Thoreau (1817-62) were primarily individualists who believed in a return to nature, the non payment of taxes, and passive resistance to state control. In these respects Thoreau strongly influenced Gandhi as did the Christian anarchist Tolstoy. See also Syndicalism

Anglicanism, adherence to the doctrine and

discipline of the Anglican as the genuine representative of the Catholic Church. See Church of England.

Anglo Catholicism: To Queen Elizabeth I the Church of England was that of the middle way in which human reason and commonsense took their place beside Scripture and Church authority. The extent to which these various factors were stressed create the distinctions between high and low church. Anglo Catholics tend to reject the term Protestant and stress the term Catholic and although few accept the infallibility of the Pope some Anglo Catholic churches have introduced in such form as the Roman ritual and teach Roman dogmas. See Catholicism. Tractarianism.

Animism: To early man and in primitive societies the distinction between inanimate and animate objects was not always obvious—it is not enough to say that living things move and non living things do not for leaves blow about in the wind and streams flow down a hillside. In the religions of early societies therefore we find a tendency to believe that life exists in all objects from rocks and pools to seas and mountains. This belief is technically known as *animism* which differs from *animism* a somewhat more sophisticated view which holds that natural objects have no life in themselves but may be the abode of dead people spirits or gods who occasionally give them the appearance of life. The classic example of this of course is the assumption that an erupting volcano is an expression of anger on the part of the god who resides in it. Such beliefs may seem absurd today but it is worth realizing that we are not entirely free of them ourselves when we ascribe personalities of a limited kind to motor cars boats dolls or models which incur our pleasure or anger depending upon how well they behave.

Anthropomorphism, the ascription of human physical and moral qualities to God or gods (in psychology to gods or animals). Psychologists use the term *anthropopathy* for the ascription of such qualities specifically to the Deity.

Anthroposophy is a school of religious and philosophical thought based on the work of the German educationist and mystic Rudolf Steiner (1861-1925). Steiner was originally an adherent of Madame Blavatsky's theosophical movement (see Theosophy) but in 1913 broke away to form his own splinter group the Anthroposophical Society following ideological disputes over the alleged divinity of the Indian boy Krishna murti. Steiner was much influenced by the German poet and scientist Goethe and believed that an appreciation and love for art was one of the keys to spiritual development. One of the first tasks of his new movement was the construction of a vast temple of arts and sciences known as the Goetheanum to act as the headquarters of the society. This structure which was of striking and revolutionary architectural style was unfortunately burnt down in 1922 to be replaced by an even more imaginative one which today is one of the most interesting buildings of its kind in the world. Anthroposophy which ceased to expand greatly following its founder's death is nevertheless well established in various parts of the world with specialised and often very well equipped schools and clinics which propagate the educational and therapeutic theories of the movement. These which include the allegedly beneficial powers of music, coloured lights etc have made little impact on modern educational ideas, but the schools have acquired a reputation for success in the training of mentally handicapped children though one suspects that these successes are due to the patience and tolerance exercised in these establishments rather than to the curative value of colour or music therapy itself. Despite its apparent eccentricities anthroposophy has made its mark on art and architecture the outstanding modern painter Kandinsky for example being particularly influenced by Steiner's ideas and teachings.

Anticlericalism resentment of priestly powers and privileges traceable in England to Wyclif's insistence in the 14th cent. on the right of all men to have access to the Scriptures. The translation of the Bible into the common

language was a great landmark in the history of the Bible and the English language. Wyclif's principles were condemned by the Roman Church of his time but were readily accepted during the Reformation. Tudor anticlericalism arose from motives ranging from a greedy desire to plunder the riches of the Church to a genuine dislike of the powers of the priesthood whose spiritual courts still had the right to decide on points of doctrine or morals in an age when the layman felt he was well able to decide for himself. In innumerable ways the Church was permitted to extort money from the laity. It is generally agreed says Trevelyan that the final submission of church to state in England was motivated quite as much by anticlericalism as by Protestantism. The rise of the Reformed churches in England satisfied the people generally and anticlericalism never became the fixed principle of permanent parties as happened in France and Italy from the time of Voltaire onwards.

Antisemitism a term first applied about the middle of the last century to those who were anti Jewish in their outlook. Although this attitude was prevalent for religious reasons throughout the Middle Ages modern antisemitism differed (a) in being largely motivated by economic or political conditions and (b) in being doctrinaire with a pseudo scientific rationale presented by such men as Gobineau (1816-82) and Houston Stewart Chamberlain (1855-1927) and later by the Nazi and Fascist philosophers. Beginning in Russia and Hungary with the pogroms of 1882 it gradually spread south and westwards where in France the Dreyfus case provided an unsavoury example in 1894. Thousands of Jews from Eastern Europe fled to Britain and America during this period for in these countries antisemitism has rarely been more than a personal eccentricity. During the last war the murder of six million Jews by the Nazis and their accomplices led to a further exodus to various parts of the world and finally to the creation of the state of Israel.

The individual Jew hated makes unconscious use of the psychological processes of projection and displacement, his greed or sexual guilt is projected on to the Jew (or Negro or Catholic) because he cannot bear to accept them as his own emotions and his sense of failure in life is blamed on his chosen scapegoat rather than on his own inadequacy.

But there are social causes too and politicians in some lands are well versed in the technique of blaming unsatisfactory conditions which they themselves may have in part produced upon minority groups and persuading others to do the same. Historically the Jew is ideally suited for this role of scapegoat. (1) In the Middle Ages when usury was forbidden to Christians but not to Jews the latter often became moneylenders incurring the opprobrium generally associated with this trade (e.g. to the simple minded Russian peasant the Jew often represented not only the Christ killer but also the moneylender or small shopkeeper to whom he owed money). (2) Many trades being closed to Jews it was natural that they concentrated in others thus arousing suspicions of influence (e.g. Jews are felt to occupy a place in certain trades and professions which far exceeds their numerical proportion to the population as a whole). (3) Even with the ending of ghetto life Jews often occupy *en masse* some parts of cities rather than others and this may lead to resentment on the part of the original inhabitants who begin to feel themselves dispossessed. (4) Jews tend to form a closed society and incur the suspicions attached to all closed societies within which social contacts are largely limited to members, marriage outside the group is forbidden or strongly disapproved of and the preservation, among the orthodox of cultural and religious barriers tends to isolate them from their fellow citizens. Discrimination hateful as it is does not come from one side only and it is such barriers as these that help to maintain an old and cruel folly. See Racism, Zionism, Judaism.

Antivivisection, opposition to scientific experimentation upon live animals based according to

its supporters both on the moral grounds of the suffering imposed, and on the less secure claim that many doctors and scientists of repute have rejected the value of information gained in this way. It is true that the protagonists of the movement during its early days in the mid 19th cent. included a number of eminent physicians and surgeons—but few today—whatever their moral scruples—would deny the value of the results obtained. Without animal experiments we should be without vaccines, sera, or anti-toxins against smallpox, tetanus, typhoid, diphtheria, poliomyelitis and a multitude of other diseases. We should have no detailed knowledge about vitamins or about the effects of radioactive fallout. We would be unable to test out new drugs for safety before using them on human beings. There are in Britain two or three large national anti vivisection societies and several smaller ones. Much of their work is co-ordinated through the British Council of Anti Vivisection Societies. Animal experimentation is controlled by Act of Parliament which makes obligatory the possession of licences by experimenters, inspection of laboratories by the Home Office and the issue of annual returns of experiments. Many people would like the number of experiments on animals reduced and the law changed to prohibit any experiment in which there is any risk of inflicting suffering.

Apartheid an Afrikaans word meaning apartness referred to by South African Government spokesmen as separate development or self development. To others it means the system of total racial discrimination between black and white South Africans—the permanent inhabitants of the country—as enforced by the Nationalist Party since it came to power in 1948. Some degree of racial segregation has existed in South Africa since the earliest days of colonialism in the mid 17th cent. and the policy was continued by the United Party under Smuts and Hertzog from 1924 onwards though it was never a political issue. This changed when the Nationalist Party gained power and oppressive measures against the non White segment of the population have grown steadily adding to the racial hatred of the Afrikaans under Malan, Strydom, Verwoerd and Vorster. *Apartheid* involves the beliefs in racial purity and *baaskap* or white supremacy. It means keeping vast African populations in a condition of helotry. The official policy of the South African Government is to create separate self governing black states in which the Africans would be guided to self-government and it is claimed eventually to independence. The first so-called bantustan reserve was set up in the Transkei in 1962. But Africans with 70 per cent of the population would have only about 13 per cent of the land. Cities and mineral areas would remain the reserve of the whites. Total *apartheid* or complete separation of the black and white races in South Africa remains unlikely to be realised since mining the main industry of the country is based on relatively low paid African labour.

Afrikaner conservatism may be challenged by the recent split in the governing Nationalist Party—between the *verligtes* (enlightened) and the *verkramptes* (closed inwards)—a development which could lead to a more humanitarian outlook on race.

Apollinarianism, the heretical belief taught by Apollinarius (c 313-c 390) bishop of Laodicea near Antioch that in Jesus the human mind was replaced by the Divine Mind or Logos. The sect was later absorbed by the Monophysites (q.v.).

Arianism, formed the subject of the first great controversy within the Christian Church over the doctrine of Arius of Alexandria (d 336) who denied the divinity of Christ. The doctrine although at first influential, was condemned at the Council of Nicea (325) called by the Emperor Constantine, at which Arius was opposed by Athanasius, also of Alexandria, who maintained the now orthodox view that the Son is of one substance with the Father. Arius was banished and the heresy had died out by the end of the 4th cent. but disbelief in the divinity of Christ has formed part of the doctrine of many minor sects since, notably in Unitarianism (q.v.).

Arminianism, the doctrine of Jacobus Arminius or Jakob Harmensen (1560-1609) the Dutch minister of a Protestant church in Amsterdam who had trained in the universities of Leyden and Geneva where he learned the Calvinistic doctrine of predestination (See Calvinism). Later he became deeply convinced of the falsity of this belief which maintained that God had by an eternal decree predestined which people were to be saved and which eternally damned. In face of the bitter opposition of his opponent Franz Gomar and his party who held this view Arminius asserted that God bestows for goodness and eternal life on all who repent and believe in Christ. In England a modified Arminianism was later to become the theology of Wesleyan Methodism.

Assassins, a sect of Moslem Shiites founded by the Persian Hasan i Sabbah (c 1090) which for more than two centuries established a rule of terror all over Persia and Syria. The coming of the Mongols in 1250 destroyed them in Persia and the Syrian branch suffered a similar fate at the hands of the then Mamluk sultan of Egypt, c 1270. It was a secret order ruled over by a grand master under whom the members were strictly organised into classes according to the degree of initiation into the secrets of the order. The devotees, belonging to one of the lower groups, carried out the actual assassinations under strict laws of obedience and total ignorance of the objects and ritual of the society. It is believed that the latter were given ecstatic visions under the influence of hashish whence the term *hashishashim* which became corrupted to *assassin*.

Associationism. In psychology the Associationist school of the 19th cent. accepted the association of ideas as the fundamental principle in mental life. It was represented in Britain by the two Mills and Herbert Spencer in Germany by J. F. Herbart (1776-1841). To these mental activity was nothing but the association of ideas conceived of as units of both thought and feeling—the emotion of anger or the perception of a chair were both ideas—and apart from them the self did not exist. Personality was simply a series of these units coming and going adding to or cancelling each other in accordance with rigid and mechanistic scientific laws.

Assumption of the Virgin. The Roman Catholic belief that the Blessed Virgin ascended bodily to heaven after her death was proclaimed by Pope Pius XII towards the end of 1950. Protestants are liable to make the mistake of supposing that such dogmas are new additions to the faith invented by the pope of the moment. According to Catholic doctrine no addition can be made to the faith once delivered to the saints and every dogma is justified by reference to Bible texts and the traditions of the Church. Both Eastern and Western Churches have been permitted to believe in the Assumption of the Virgin for over a thousand years and the new dogma merely clarifies the old belief and makes it binding on the faithful.

Astrology a pseudo-science bearing much the same historical relationship to astronomy as alchemy does to chemistry. Originally it was divided into the two branches of Natural Astrology which dealt with the movements of the heavenly bodies and their calculation, and Judicial Astrology which studied the alleged influence of the stars and planets on human life and fate. It was the former that developed into modern astronomy the latter was and remains, a primitive myth.

Astrology owes most to the early Babylonians or Chaldeans who being largely nomadic in an environment which permitted an unobstructed view of the sky readily accepted the idea that divine energy is manifested in the movements of the sun and planets. Gradually this concept became enlarged and the relative positions of the planets both in relation to each other and to the fixed stars became intercast together with the idea of omens—that, if a particular event occurred whilst the planets were in a particular position, the recurrence of that position heralded a recurrence of the same sort of event. Soon the planets became associated with almost every aspect of human life. They were bound up with

the emotions with parts of the body so that astrology played quite a large part in medicine up to late mediaeval times. Not only was the position of the planet to be considered but also the particular sign of the zodiac (or house of heaven) it was occupying and it was believed possible to foretell the destiny of an individual by calculating which star was in the ascendant (i.e. the sign of the zodiac nearest the eastern horizon and the star which arose at that precise moment) at the time of his birth. Astrology was popular among the Egyptians the Romans (whose authorities found the Chaldean astrologers a nuisance and expelled them from time to time) and during the Middle Ages when astrologers were often highly respected.

Despite the apparent absurdity of astrological beliefs—for example how could the pattern of light from stars billions of miles away possibly influence the temperament of single individuals on earth—a substantial number of intelligent and well educated people took its study in all seriousness. The most interesting convert was the psychologist and philosopher Carl Jung who conducted a complex experiment in which he compared the birth signs of happily married and divorced couples and claimed to find that those most favourably matched in astrological terms were also those more likely to have permanent wedded bliss. Jung's otherwise world shaking finding has been shown to be based on a simple statistical fallacy and is likely to be of little practical value to young people uncertain about their choice of marriage partner. However Jung took his findings as evidence for his own theory of "synchronicity" (qv) an involved and near metaphysical notion which holds that events in the universe may be significantly related in a non causal fashion. For simpler souls astrology is still principally a source of entertainment though human beings natural inclination to peer into the future often draws them into astrology with at least semi serious motives.

Atheism See God and Man

Atlantis a mythical continent supposed to have lain somewhere between Europe and America and a centre of advanced civilisation before it was inundated by some great natural cataclysm in pre Christian times. There is little if any serious historical or archeological evidence for its existence but the legend of the Golden Land destroyed when the waters of the Atlantic closed over it has remarkable staying power and is believed by large numbers of people. Plato wrote convincingly about the wonders of Atlantis in his dialogues *Timaeus* and *Critias* while other writers have suggested that the biblical story of the Flood is based on fragmentary accounts of the Atlantean deluge. The lost continent is also of occult significance largely as the result of the writings of W. Scott Elliott whose book *The Story of Atlantis* (recently re published by the Theosophical Society) alleged that by clairvoyance he had been able to contact the spirits of Atlanteans who had been destroyed because of their addiction to black magic. There even exists in Britain today a minor but ardent religious group. The Atlanteans who hold that Atlantis still exists today but on a different metaphysical plane and that it is possible to communicate with it via individuals with supposedly mediumistic powers (see Spiritualism). Members of the Atlanteans meet regularly to hear talks about the vanished continent and trance addresses by one of the high priests of Atlantis Hello Anaphaphus. Such beliefs though unusual are essentially harmless and merely reflect the great variety of religious attitudes which human beings enjoy and to which they are entitled.

Atomism. (1) In philosophy the atomists were a group of early Greek thinkers the most important of whom were Leucippus (fl. c. 440 B.C.) and his younger contemporary Democritus (c. 460-370 B.C.). Prior to these men although it had been agreed that matter must be composed of tiny ultimate particles and that change must be due to the manner in which these mingled or separated from each other it was supposed that there existed different types of particle for each

material—e.g. for flesh wood hair bone. The atomists taught that atoms were all made of a single substance and differed only in the connections (pictured as hooks grooves points etc.) which enabled them to join each other in characteristic ways. There was the first move towards modern atomic theory and a predecessor of the modern concept of chemical linkages. (2) In psychology atomism refers to any theory which holds that mental states can be analysed without loss into elementary units e.g. Associationism and Behaviourism (qv).

Authoritarianism a dictatorial form of government as contrasted with a democratic one based on popular sovereignty. Its alleged advantages are the avoidance of the delays and inefficiency said to be characteristic of the latter but like Bolshevism the word is used today mainly as a form of abuse.

B

Baconian Method the use of the inductive (as opposed to the deductive or Aristotelian) method of reasoning as proposed by Francis Bacon in the 17th cent. and J. S. Mill in the 19th cent. Deduction argues from supposedly certain first principles (such as the existence of God or Descartes's "I think, therefore I am") what the nature of the universe and its laws must be whereas the only means of obtaining true knowledge of the universe in Bacon's view was by the amassing of facts and observations so that when enough were obtained the certain truth would be known in the same way that a child's numbered dots in a play book joined together by a pencilled line create a picture. However this is not the way science progresses in practice (see Falsification). Bacon underrated the importance of hypothesis and theory and overrated the reliability of the senses. In discussing the scientific tradition Sir Karl Popper in his book *Conjectures and Refutations* says "The most important function of observation and reasoning and even of intuition and imagination is to help us in the critical examination of those bold conjectures which are the means by which we probe into the unknown." Two of the greatest men who clearly saw that there was no such thing as an inductive procedure were Galileo and Einstein.

Bahai'ism faith teaching the unity of religions and the unity of mankind. It arose in Iran from the teachings of the Bab (Mirza Ali Mohammed 1820-50) and the Baha'ullah (Mirza Husain Ali 1817-92) thought to be manifestations of God who in his essence is unknowable. Emphasis is laid on service to others. It has communities in 900 states.

Baptists a Christian denomination whose distinctive doctrines are that members can only be received by baptism upon the confession of their faith and sins and that baptism in no wise appertains to infants. Baptism is therefore by total immersion of adults. Modern Baptists base their doctrines upon the teaching of the Apostles and some hold that the Anabaptists (qv) maintained the true belief though what they regard as the corruption of the Roman Church in mediaeval times. On the other hand any connection with the Anabaptist movement during the Reformation is rejected and the beginning of the modern Church is traced to John Smyth a minister of the Church of England who in Amsterdam came under the influence of the Arminians (qv) and Mennonites. Smyth died in 1612 when the first Baptist church in England was built at Newgate. This the General Baptist Church rejected Calvinistic beliefs and held the Arminian doctrine of redemption open to all but some years later a split occurred with the formation of the Particular Baptist Church which was Calvinist in doctrine. In 1891 the two bodies were united in the Baptist Union and today the sect is spread throughout the world notably in the U.S.A.

The Anabaptist movements of Germany Switzerland and Holland also practised adult baptism in addition to a primitive communism.

and demanded social reforms. Persecuted by both Catholics and Protestants their leader Thomas Münzer and many others were burned at the stake (1525). However this sect was noted for its violence under a religious guise and its taking over of the state of Münster in 1533 was characterised by wild licentiousness since as Antinomians they believed that the elect could do no wrong. A revival begun by Menno Simons (d. 1561), a Dutch religious reformer led to the formation of the Mennonite sect which whilst rejecting infant baptism set up the objectionable features of the Anabaptists. This reformed sect still exists as small agricultural groups in the original strongholds of the movement and in the United States.

Beat Generation a term first used by the American writer Jack Kerouac (d. 1969) author of *The Town and the City* and *On The Road* to define various groups spread across the face of the country but notably New York and San Francisco who belonging to the post war generation represented a complex of attitudes. Briefly these are rejection of the values of the past and lack of conviction in the possibility of a future for humanity—hence an acceptance of nothing but the immediate present in terms of experience and sensations rebellion against organised authority not out of any political conviction (as in the case of anarchists) but rather from lack of any interest or desire to control events nature or people contempt for the Square—the orthodox individual who sticks firmly in his rut plays it safe and remains confident of the richness and decency of his moral values. The Beatnik has contracted out of what one of them describes as 'an increasingly meaningless rat race rigged up by and for Squares which wastes effort and brutalises feeling. He loathes the pretences without which he claims the Square cannot succeed and throwing off all masks is in different to the opinions of others he dresses or the need to work thus entering into the inescapable truth and squalor of his own being. He digs (hikes) everything tries everything from drugs to sexual relationships which have no significance outside the sensations of the moment to the opinions of others he dresses or the need to work thus entering into the inescapable truth and squalor of his own being. All men are addressed as 'man' all women as 'chick'. Of course the above is an intellectualisation by such Beat writers as Kerouac Allen Ginsberg and Carl Solomon or Norman Miller of a philosophy which for many Beatniks would be meaningless being satisfied with any excuse for their own exhibitionism sexual promiscuity and psychopathic tendencies. Beards (in men) bare feet sloppy clothes and unwashed bodies were the familiar Beatnik uniform.

The Beat generation of the 1940s and 50s gave way to the Love generation or Flower people with their flowers beads and cowbells. Their social philosophy was the same—living in the present unconventionally seeking personal freedom believing drugs to be essential claim not to be acting against the rat race dissociating themselves from politics taking a superficial interest in the religions of the East borrowing much of their language music and ideas on dress from the American hippy yet being living in the creation of a new and gentler society based on different forms and values.

Both the Beat and the Love generations have appealed largely to the younger segment of society who disillusioned with orthodox religion and traditional politics have sought outlets for their powerful if poorly expressed drives and emotions. Early group manifestations of the Beat and Drop-out variety had limited internal structure and no co-ordinated political motive and have thus constituted no threat to the established political forces and governments of the world. Quite recently however clear signs of coherent organisation in these numerically substantial groups have begun to emerge giving rise to a powerful and established movement known as the "underground" (q.v.).

Behaviourism, a school of psychology founded in 1914 by J. B. Watson (1878-1958) an animal psychologist at Johns Hopkins University Baltimore. Its main tenet was that the method of introspection and the study of mental states

were unscientific and should be replaced by the study of behaviour. When animals or human beings were exposed to specific stimuli and their responses objectively recorded or when the development of a child as seen in its changing behaviour was noted these alone were methods which were truly scientific. Watson contributed an important idea to psychology and did a great deal towards raising it to the largely philosophical speculations of the past. But he also went to absurd extremes as in his view that thought is nothing but subvocal speech consisting of almost imperceptible movements of the tongue throat and larynx (i.e. when we think we are really talking to ourselves) and his further opinion that heredity is except in grossly abnormal cases of no importance. He claimed that by conditioning the ordinary individual could be made into any desired type regardless of his or her inheritance.

The work of Ivan Pavlov had begun about 1901 but was unknown in America until about ten years later and it was through another Russian Vladimir Bekhterev that the concept of conditioning was introduced into the country. Bekhterev's book *Objective Psychology* describing his new science of reflexology was translated in 1913 and played a great part in the development of Behaviourist ideas. The conditioned reflex became central to Watson's theory of learning and habit formation (e.g. he showed that a year old child at first unafraid of white rats became afraid of them when they came to be associated with a loud noise behind the head). Finally all behaviour including abnormal behaviour came to be explained in terms of conditioned responses these were built up by association on the infant's three innate emotions of fear rage and love of which the original stimuli were for the first loud noises and the fear of falling for the second utterance with freedom of movement and for the third patting and stroking.

Because of its considerable theoretical simplicity and its implicit suggestion that human behaviour could be easily described (and even modified or controlled) Pavlovian psychology appeared very attractive to the American mind. In Russia and before long it became the official dogma in universities and research laboratories. Whereas in America and Western Europe its severe limitations became gradually apparent in Russia these were ignored or disguised for ideological reasons with the inevitable outcome that Soviet psychology failed to evolve and at one stage seemed to be no more than a pallid offshoot of physiology. The recent liberalisation which has been taking place throughout Soviet society has led to a considerable broadening of scientific horizons and Pavlovian ideas are no longer looked upon with such unquestioning reverence. In non-Communist countries simple Watsonian behaviourism has evolved into more sophisticated studies of animal learning largely pioneered by the Harvard psychologist Skinner. These techniques which have shown that animals from monkeys to rats may be taught to solve a remarkable range of physical problems (such as pressing complex sequences of buttons or levers to escape from a cage) have themselves turned out to be rather disappointing in terms of advancing our general understanding of the workings of the human and animal brain. There is a growing feeling among psychologists that the real keys to the understanding of mankind will only be found through the study of man himself and not of his simpler animal cousins. See also Gestalt psychology.

Benjaminism See Utilitarianism.

Black Power The division of the world's population into races is now generally agreed by scientists to have arisen as the result of climatic and environmental pressures—the darker more highly pigmented peoples tending to be better equipped to withstand higher solar output than the fairer more northerly based types. For various reasons again largely climatic and environmental the first great advances in civilisation came from the temporary ascendancy over the black or near black. Until quite recently—not much more than a century—the technological gulf between white and black

was so vast that the negroid races were often held in slavery by the Europeans and while such a thought might be repugnant to most today attitudes to coloured people still reflect a notion of inherent white superiority which it is easy to deny intellectually but difficult to shake off emotionally. In the U.S.A. the most advanced and at the same time the most orientated multi racial society in the world the role of the substantial negroid population has changed dramatically in the last hundred years shifting from that of slave to friendly servant and then to near or theoretical equal. With this shift has come a corresponding change in the black community's view of itself from relief at being no longer slaves to gratitude at being allowed to do the menial jobs in the American society. More recently with advances in educational opportunity and increasing political liberalisation the attitude of the Negro in the U.S.A. has shifted yet again from subservience to intellectual and racial equality and even perhaps to inherent superiority. This new stand rare at first but spreading rapidly across America and other parts of the world throughout the 1960s has crystallised in the concept and ideology of Black Power a movement of growing significance and importance in modern society. It is hard to trace the moment at which this formally emerged but one of its first expressions was the use by Negroes of the phrase Black is beautiful an apparent awakening of the belief that their colour physique features hair etc were in no way aesthetically inferior to those of Europeans. Suddenly in Negro communities it became no longer fashionable to artificially straighten hair to bleach the skin or even to copy white American clothing social habits speech and mannerisms. Alongside this highly important psychological jump a rejection of the white man's social patterns—came an increasing rejection of his political machinery as well a belief that the black races should have political autonomy and power of their own and not as part of an integrationist evolution of Caucasian societies.

The Black Power movement at this moment has no formal political representation in the United States largely because it spurns the normal democratic approach of offering up candidates for election but its strength and growing potency is well understood by enlightened American politicians who take careful account of its views on current or proposed racialist legislation. Its present strategy is a declared one of attaining black supremacy and autonomy rapidly by violence and revolution if necessary and it has supporters in all sections of the Negro population—and among many of the younger whites as well. Whether open conflict between blacks and whites in America will ever break out on a large scale is at this time uncertain but increasing liberalisation and better opportunities for educational and social advancement for Negroes must ultimately serve to ease tension, while an oppressive white backlash would inevitably provoke bloody conflict. The overt aggression and ruthlessness of the Black Power movement and its adherents is probably an understandable swing of the pendulum following centuries of abuse and suppression but its latent strength and grim sense of purpose should not be underestimated. The famous incident at the Mexico Olympics when American Negro athletes gave the Black Power salute as their national anthem was being played brought the existence of the movement to the attention of millions of viewers across the world and probably served as a salutary warning to white people to realise that the days of "inferior and superior races are gone for ever.

Bolshevism, an alternative name for Communism (qv) usually used in the West in a derogatory sense. When the Russian Social Democratic Party at a conference held in London in 1903 split over the issue of radicalism or moderation, it was the radical faction headed by Lenin who subsequently led the 1917 Revolution and became first Head of State of the Soviet Union) which polled the majority of votes. The Russian for majority is *bolshevstvo* and for

minority *menshévstvo* hence the radicals became known as Bolsheviki and the moderates as Mensheviks anglicised as Bolsheviks and Mensheviks. See Communism Marxism.

British Israelites a religious group who hold the race theory that the English speaking peoples (of the White Race) are the lineal descendants of the lost Ten Tribes of Israel (deported by Sargon of Assyria on the fall of Samarra in 721 B.C.) They believe the Anglo Saxons to be God's Chosen People in the literal sense of the term as it is used in the Old Testament by whom the world will be brought in readiness for the Millennium. The official organisation is the British-Israel World Federation of which the official journal is the *National Message*. Some British Israelites have the notion that the future can be foretold by the measurements of the Great Pyramid.

Buddhism, one of the great Oriental religions. It arose against the background of Hinduism in north India in the 6th cent. B.C. Its founder (real or legendary) being the Hindu prince Siddhartha Gautama known as the Buddha or Enlightened One. Distressed by the problem of human suffering from which even death allowed no escape—since Buddha accepted the Hindu doctrine of a cycle of lives—he left his palace and his beloved wife and child to become a religious mendicant and ascetic studying with out success for six years the beliefs of Brahmin hermits and self torturing recluses. After this fruitless search he sat down under a tree (the Bo tree) and finally came to understand the cause and cure of suffering. The result of his meditations are enshrined in the four noble truths which are (1) that existence is unhappiness (2) that unhappiness is caused by selfish desire or craving (3) that desire can be destroyed (4) that it can be destroyed by following the noble eightfold path whose steps are right views right desires right speech plan and truthful right conduct including abstinence not only from immorality but also from taking life whether human or animal right livelihood harming no one right effort always pressing on right awareness of the past the present and the future and lastly right contemplation or meditation. The more man acquiesces merit by following these rules in his chain of lives the sooner is *Nirvana* attained he loses his individuality not by annihilation but as the dewdrop slips into the shining sea by merging with the universal life.

Buddhism teaches the way of salvation through ethics and discipline. It preaches the law of *karma*—that a man's actions control his destiny after death as inevitably as cause produces effect so that his future is solely in his own keeping. A universal God plays no part in this religion, and in many Buddhist nations no word exists for the concept which was neither affirmed nor denied by Buddha himself but simply ignored. Nor did Buddha claim to be other than a man although much superstition entered the religion at a later date. Prayers were made to Buddha ritual developed sacred relics preserved under stupas and the belief in a succession of Buddhas introduced the sacred writings (*Tripiṭaka*) are divided into three parts for the layman the monks the philosophers. They were produced by devotees at three councils—the first held immediately after the death of Buddha at the age of 80 the last at the order of King Asoka in 244 B.C. The founder himself wrote nothing.

Buddhism spread to Ceylon, Nepal, Tibet, Mongolia, Indo China, Burma, Siam, China and Japan although on the whole losing influence in India. In Tibet, Buddhism developed into Lamaism (qv). In Ceylon and Burma it persisted in its pure form (the Hinayana) while in China and Japan it developed into the Mahayana with its bodhisattvas and avatars. Sects developed one of the most important being the Chinese Ch'an (Japanese Zen) Buddhism (qv). Outside Asia there are active movements in many Western countries where the serenity and rational humanism of Buddhism appeals to intellectuals as diverse as staid humanists and eccentric beatniks.

Bushido the traditional code of honour of the Samurai or Japanese military caste corre-

sponding to the European concept of knight hood and chivalry with which it took its separate origin in the 12th cent. Even today it is a potent influence among the upper classes being based on the principles of simplicity honesty courage and justice which together form a man's idea of personal honour. *Bushido* was strongly influenced by Zen Buddhism (q.v.).

C

Calvinism the branch of Protestantism founded basically (although preceded by Zwingli and others) by Jean Calvin (1509-64) who was born in Noyon in Picardy. John Calvin as he is usually called from the Latin form of his name Calvinus provided in his *Institutions of the Christian Religion* the first logical definition and justification of Protestantism thus becoming the intellectual leader of the Reformation as the older Martin Luther was its emotional instigator. The distinctive doctrine of Calvinism is its dogma of predestination which states that God has unalterably destined some souls to salvation to whom efficacious grace and the gift of perseverance is granted and others to eternal damnation. Calvinism as defined in the Westminster Confession is established in the Reformed or Presbyterian churches of France Holland Scotland etc as contrasted with the Lutheran churches and its harsh but logical beliefs inspired the French Huguenots the Dutch in their fight against Spanish Catholic domination and the English Puritans. The rule set up under Calvin's influence in Geneva was marred by the burning at the stake of the anatomist Servetus for the heresy of pantheism or as we should say Unitarianism.

Perhaps its greatest single influence outside the Church was the result of Calvinist belief that to labour industriously was one of God's commands. This changed the mediaeval notions of the blessedness of poverty and the wickedness of usury proclaimed that men should shun luxury and be thrifty yet implied that financial success was a mark of God's favour. In this way it was related to the rise of capitalism either as cause or effect. Max Weber the German sociologist believed that Calvinism was a powerful incentive to or even cause of the rise of capitalism (q.v.). Marx Sombart and in England J. M. Keynes have asserted the reverse view—that Calvinism was a result of developing capitalism being its ideological justification.

Capitalism is an economic system under which the means of production and distribution are owned by a relatively small section of society which runs them at its own discretion for private profit. There exists on the other hand a propertyless class of those who exist by the sale of their labour power. Capitalism arose towards the end of the 18th cent in England where the early factory owners working with small scale units naturally approved of free enterprise and free trade. But free enterprise has no necessary connection with capitalism by the beginning of this century monopolies were developing and state protection against foreign competition was demanded. Capitalism is opposed by those who believe in socialism (q.v.) first for the moral reasons that it leads to economic inequality and the exploitation of labour and the consuming public and that public welfare rather than private profit should motivate the economic system; secondly for the practical reason that capitalism leads to recurrent economic crises. Defenders of the system however maintain that it conduces to efficient production by providing the strongest incentive to enterprise and good service.

Catholicism For those who are not Roman Catholics the term Catholic has two separate meanings. The more general refers to the whole body of Christians throughout the world the more specific refers to a particular view of Christianity. In this latter sense the Church of England, the Orthodox Eastern Churches, and others consider themselves Catholic meaning that (a) they belong to Christ's Church as

organised on an accepted basis of faith and order (b) they insist on the necessity of liturgical worship through established forms (c.g. baptism holy communion) (c) they emphasise the continuity of Christian tradition by the use of ancient creeds (c.g. the Apostles Creed the Nicene Creed) and regard the ministry as a succession (Apostolic succession) deriving from early practice. In this sense there is thought to be no necessary contradiction between Catholicism and Protestantism regarded as a renewal of the Church in the 16th cent. by an appeal to the Scriptures as interpreted by the early Fathers of the Church. This definition obviously excludes Quakers Christian Scientists and many Nonconformist sects.

The Roman Catholic Church is the religious organisation of all those who acknowledge the bishop of Rome as head of the Christian Church recognising him as the lawful successor of St Peter who was the apostle appointed by Christ to be the head of the Church. Whereas in the Protestant Churches prayer and preaching play a central part (each individual soul seeking direct communication with God) in Roman Catholic worship the central service is the Mass or Holy Eucharist the seven sacraments (baptism confirmation eucharist penance extreme unction orders and marriage) being administered by a special priestly Church discipline and organisation are strong and authoritarian. See Papal Infallibility.

Catholic Apostolic Church a body of Christians which originated in England c. 1831 founded on the teaching of Edward Irving (d. 1834). They disapprove of the term Irvingites by which they are sometimes known. The common doctrines of Christianity are accepted symbolism and mystery characterise the elaborate liturgy and lights and incense are used.

Characterology the attempt made over many centuries to classify people into personality types on the basis of physical or psychological characteristics. The first attempt was made by Hippocrates in the 5th cent. B.C. who classified temperaments into the *sanguine* (or optimistic) the *melancholic* the *choleric* (or aggressive) and the *phlegmatic* (or placid) these were supposed to result from the predominance of the following humours in the body: red blood black bile yellow bile or phlegm respectively. Theophrastus a pupil of Aristotle described with examples thirty extreme types of personality (e.g. the talkative the boorish the miserly etc.) these were basically literary and imaginative but about the same time Physiognomy arose which attempted to interpret character from the face. Physiognomy became of importance again during the Renaissance and there are still those today who believe in it in spite of the fact that broadly speaking there is no connection whatever between facial features and personality (i.e. although it may be possible to tell from the features that a man is an idiot or some extreme abnormal type and some idea of character may be obtained from an individual's characteristic facial expressions it is not possible to tell (as Johann Lavater the best known physiognomist of the late 18th cent. believed) from the shape of the nose height of the brow or dominance of the lower jaw whether anyone is weak intellectual, or determined). The contention of the 19th cent. Italian criminologist Cesare Lombroso that criminals show typical facial characteristics—prominent cheekbones and very slanting eyes receding brow large ears of a particular shape—was disproved by Karl Pearson early this century when he found that 3 000 criminals showed no significant differences of features carefully measured, from a similar number of students at Oxford and Cambridge.

It has, however, been noted that people in general tend to be intellectual or emotional inward or outward looking and this observation is reflected in the classifications of the Scottish psychologist Alexander Bain (d. 1903) into intellectual artistic, and practical. Nietzsche's Apollonian and Dionysian types William James's tender and tough minded and C. G. Jung's introvert and extrovert. Careful experiments have shown that

these are not clear cut and that most in dividuals fall in between the extremes

Some connection has been found between temperament and body build. The German psychiatri Ernt Kretschmer (b 1888) showed that manic depressive patients and normal people who are extroverted and tend to alter nate in mood (as do manic depressives to an exaggerated degree) were usually short and stout or thick set in build. Schizophrenics and normal people who both show shyness serious or introverted reactions were usually tall and slender. The former of psychic body build is cyclothymic in temperament the latter with chloothymic temperament are of two bodily types—the tall and thin or asthenic and the muscularly well proportioned or athletic. The American Sheldon has confirmed these observations on the whole and gone into further details. According to him the basic body types are (1) *endomorphie* (rounded build) corresponding to Kretschmer's 'psymic' usually associated with the *viscerotonic* temperament (relaxed sociable) (2) *mesomorphie* (quintessentially athletic build) normally associated with the *somatotonic* temperament (energetic asertive) and (3) *ectomorphie* (linear build) normally associated with the *cerebrotonic* temperament (anxious submissive restles). Glandular and metabolic factors have considerable effect on human personality and also to some extent on physique. It is not too surprising, therefore to find an association between body build or somatotype as Sheldon termed it and general mood. However Sheldon's original clear cut and oversimplified categories of body type are no longer looked upon as reliable indicators of personality.

Chartism, a socialistic movement in England (1837-55) which attempted to better the conditions of the working classes. Named after The People's Charter of Francis Place (1834) its programme demanded: (1) universal manhood suffrage (2) vote by ballot (3) equal electoral districts (4) annual parliaments (5) payment of members (6) abolition of their property qualifications. Chartism was supported by the Christian socialists (qv) J F D Maurice (1800-72) and Charles Kingsley (1819-75) with certain qualifications. The movement while doomed to an early death had considerable influence on the evolution of socialist ideas in England. It is worth noting that its demands—with the exception of the unworkable annual parliament—have largely been met today though at the time they were thought by many to be both outrageous and impossible.

Chauvinism a term applied to any excessive devotion to a cause particularly a patriotic or military one. The word is derived from Nicholas Chauvin whose excessive devotion to Napoleon made him a laughing stock.

Chirogony the attempt to read character from the lines in the hand (as contrasted with chiromancy or palmistry in which an attempt is made to tell the future in the same way) is an ancient practice which like astrology (qv) has no discernible scientific basis but a very considerable popular following. As with astrology where it is hard to see what kind of link could exist between the constellations and human behaviour so it is equally hard to see how the configuration of lines on the hand could be paralleled by psychological attributes. This argument might be thought of as irrelevant if palmistry etc actually had predictive power but the plain fact is that when put to a scientific test practitioners of these arts turn out to show no abilities beyond those with which a normally perceptive individual is equipped.

Chiropractic the art of manipulation of the joints in particular the spine as a means of curing diseases is a slightly fashionable quasi medical practice. Few qualified doctors employ its questionable principles though as with its near neighbour osteopathy it seems on occasions to be a useful complement to medical treatment. Much controversy surrounds the status of practitioners of fringe medicine of this kind. In America osteopathy (bone manipulation) which seems to be beneficial in many cases for the condition known as prolapsed or slipped

disc is becoming gradually merged into orthodox medical practice.

Christadelphians a religious denomination formed in the U.S.A. about 1848 at the time of the American Civil War by John Thomas an Englishman from London. They claim to represent the simple apostolic faith of the 1st cent. and in common with many other sects hold that they alone interpret the Scriptures truly. None but those who share their beliefs will rise from the dead and enjoy immortal life when Christ returns after the battle of Armageddon when His kingdom will be established on earth with its capital in Jerusalem. The political events of our time are regarded as fulfillments of biblical prophecies preceding the millennial reign of Christ over the earth. For them heaven and hell do not exist. In social life Christadelphians keep to themselves and hold aloof from organisational activities though they do take an interest in political events if only from the point of view of their belief in biblical prophecy. Christianity the religion founded by Jesus Christ whose teaching is found in the New Testament's four Gospels. Simple as His creed may seem it soon became complicated by the various ways in which Christians interpreted it and the differences within the early Church are reflected in the numerous Councils held to define truth from heresy. The Eastern Church of the Byzantine Empire from the 5th cent onwards had differed in various ways from the See of Rome and by 1054 the breach became permanent. The 16th cent Reformation was the other great break in the unity of the Church and once Protestantism had given in effect the right to each man to interpret the Scriptures in his own way the tendency to fragmentation increased so that by 1650 there were no fewer than 180 sects mostly dogmatic and intolerant towards each other. Today there are many more some of which are mentioned in this section under the appropriate headings. Nevertheless there are signs today that the trend of disunity is being reversed. The modern ecumenical movement which has its roots in the great missionary movement of the 19th cent aims to bring about a reunion of Christendom by uniting Christians throughout the world on the simple basis of the acceptance of Jesus Christ as God and Saviour in the basis of Christian fellowship. The movement finds expression in the World Council of Churches (qv). The Christian life is expressed in the words of Christ 'Thou shalt love the Lord thy God with all thy heart and thy neighbour as thyself. For many it is the humanitarian side of Christianity that has meaning today to accept responsibility for others as well as for oneself. See chart 111.

Christian Democrats a term describing the members of moderate Roman Catholic political parties existing under various names in Belgium, France, the German Federal Republic (most German Protestants are in East Germany), Italy and the Netherlands. In several of these countries they are the largest parliamentary party their platform being based on a programme of moderate social reform advocated by members who in many cases have been active in wartime resistant movements. In spite of efforts of Dr Adenauer of Germany and Sr Fanfani of Italy in 1955 a Christian Democratic International has failed to develop.

Christian Science a religious denomination founded by Mary Baker Eddy (1821-1910) an American lady who sought to organise a church which would restate primitive Christianity and its lost element of healing. The sacred books of the movement are the Bible and *Science and Health with Key to the Scriptures* (1891) a revision of *Science and Health* first published by Mrs Eddy in 1875. Its main tenets (quoting from an official Christian Science source) are that nothing is real save God and His spiritual creation including man in His image and likeness that man's essential nature is spiritual and wholly good that matter evil disease and sickness are unreal—illusions existing only through ignorance of God. Therefore Christian Scientists renounce for themselves medicine surgery and drugs and rely on healing through prayer.

The name of the movement seems misleading

since it has nothing to do with any of the natural sciences of which Mrs Eddy had no first hand knowledge. In using the word Mrs Eddy meant that the teaching and acts of Jesus were rooted in unchanging divine law. Mrs Eddy was at first interested in Spiritualism and afterwards having been a patient of a faith healer named Quimby, claimed to have been divinely healed. Some say she was indebted to him more than she cared to admit others that there is no link with her teaching. There is also controversy about the efficacy of her methods. The denomination has a widespread membership its newspaper the *Christian Science Monitor* read by many outside the movement has well written accounts of events going on in the world around us.

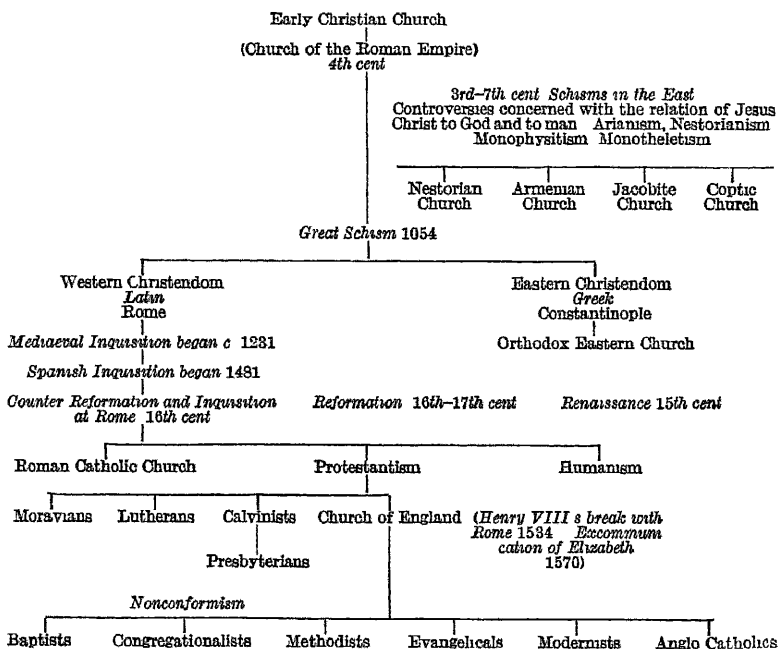

Christian Socialism a movement launched in 1848 a year of revolutions throughout the continent by a group in England designed to commit the Church to a programme of social reform. The leaders notably J. T. D. Maurice, Charles Kingsley (both Anglican clergymen) and John Ludlow were deeply moved by the wretched conditions of the British working class and the two priests had indeed given active support to the Chartist movement (*q.v.*). However all insisted that socialism in its existing forms ignored the spiritual needs of mankind and must be tempered with Christianity. Tracts were written to expose the sweated industries, the consequences of unrestrained competition and the evils following the enclosure system, but more concretely Christian socialism fostered co-operative workshops and distributive societies based on those of the Rochdale pioneers, organised a working man's college and set up elementary classes for education. It also supported the trade union movement's right to organise and bargain for its members.

The traditions of Christian socialism have been carried on by the Fabian Society by adherents of Guild Socialism and by individuals who reject Marx's teaching of revolutionary change and seek to bring it about by the methods of action through political parties, education and encouragement of the unions. They believe that Christ's teachings can only be

fully realised in a new society since Christianity implies social responsibility and material factors are admitted to have an important bearing on the ability to lead a truly religious life. In the U.S.A. the eminent theologians Paul Tillich and Reinhold Niebuhr support these views. The factory pades in Britain and the Catholic worker priests of France bear evidence to the continuing influence of the early movement. In England the Christian Socialist Movement (CSM) was revived in 1960 by the coming together of organisers of the Socialist Christian League and the Society for Socialist Clergy and Ministers. See also Fabian Society, Guild Socialism.

Church of England There is some evidence of possible continuity with the Christianity of Roman Britain but in the main the Church derives from the fusion of the ancient Celtic church with the missionary church of St Augustine who founded the see of Canterbury in A.D. 597. To Archbishop Theodore in 673 is ascribed its organisation in dioceses with settled boundaries and in parishes. St Augustine's church was in communion with Rome from the first but the Church of England was not brought within papal jurisdiction until after the Norman conquest and was at no time under the complete domination of Rome. It remains the Catholic Church of England without break of continuity but during the Reformation the royal supremacy was accepted and that of the pope repudiated. It is the Established Church (*q.v.*) the official church of the realm, crowns the sovereign and its archbishops and bishops in the House of Lords can act as a kind of conscience of the state at every stage of legislation. The policy of religious toleration has been accepted since the 16th cent. The Church is organised in two ecclesiastical provinces (Canterbury and York) and 43 dioceses. Its form of worship is embodied in the Book of Common Prayer.

The Anglican Communion comprises the churches in all parts of the world which are in communion with the Church of England. All the bishops of the Anglican Communion meet every ten years in the Lambeth Conference (first held in 1867) over which the Archbishop

of Canterbury by custom presides as *primus inter pares*. The theme of the 1968 Conference was 'The Renewal of the Church' and for the first time observers and laymen were admitted. Church of Scotland, the established national church of Scotland, Presbyterian in constitution and governed by a hierarchy of courts—the Kirk sessions, the presbyteries, the synods and the General Assembly. See Presbyterianism

Clairvoyance See Telepathy

Communism ideally refers to the type of society in which all property belongs to the community and social life is based on the principle from each according to his ability to each according to his needs. Since no such society as yet exists the word in practice refers to the Communist Party's attempt to achieve such a society by mutually overthrowing the capitalist system and establishing a dictatorship of the proletariat. The modern movement is based on Marxism as further developed by Lenin who applied Marx's analysis to the new conditions which had arisen in 20th cent capitalist society. Note the large trusts and combines which (according to the Marxian theory of concentration) with their large concentrations of capital were ousting the small producers of an earlier stage. Lenin concluded that the state (representing the ruling class) and these large capital interests were collaborating in imperialist policies which would inevitably lead to recurrent wars that the skilled worker would become more important and receiving higher wages would betray the proletariat by moving to the right, and that the poorer workers would continue to support revolutionary socialism. Communists believe that their first task is the establishment of socialism under which there remain class distinctions, private property to some extent and differences between manual and brain workers. The state is regulated on the basis from each according to his ability to each according to his work. In time this gives place to communism as described above.

Marxism-Leninism develops continuously with practice since failure to apply its basic principles to changed circumstances and times would result in errors of dogmatism. Mao Tse tung worked out the techniques of revolutionary action appropriate to China. Che Guevara the guerrilla tactics appropriate to the peasants of Latin America. Anyone says the veteran Marxist thinker Georg Lukács who thinks he can apply a book written by Lenin in 1920 to American youth in 1969 would be terribly mistaken. Two fundamental principles of communism are (1) peaceful co-existence between countries of different social systems and (2) the class struggle between oppressed and oppressing classes and between oppressed and oppressing nations. China for example holds that it is a mistake to lay one sided stress on peaceful transition toward socialism otherwise the revolutionary will of the proletariat becomes passive and unprepared politically and organisationally for the tasks ahead. See also Maoism, Marxism, Trotskyism

Confucianism Confucius (Latinised form of Kung Fu tzu) was born in 551 B.C. in the feudal state of Lu in Modern Shantung province. He was thus a contemporary of Buddha although nobody could have been more dissimilar. Where Buddha was metaphysical his thought Confucius was practical. Buddha was original. Confucius had hardly an original idea in his head. Buddha wanted to convert individuals to an otherworldly philosophy. Confucius wanted to reform the feudal governments of his time, believing that in this way their subjects would be made happier. Other religions have in their time been revolutionary. Confucius was a conservative who wanted to bring back a golden age from the past. The only respect in which Confucius agreed with the Buddha was that neither was particularly interested in the supernatural and God or gods played little part in their religions.

Much of his time was spent in going from the court of one feudal lord to another trying to impress them by his example. For he suffered from the curious belief that the example set by the ruler influences his subjects. He made much of etiquette, trembling and speaking in low tones

before princes at ease and polite with his equals and behaving with lofty courtesy to his inferiors. Promoting the idea of the Golden Mean, he was not impressed by heroic deeds or unusual people and was greatly displeased when he heard that a truthful son had reported that his father had stolen a sheep. Those who are upright, he said, are different from this. The father conceals the misconduct of the son and the son conceals the misconduct of the father. One feels that Confucius would have felt not at all out of place in an English public school. Virtue brings its own reward in this world, ceremonial is important, politeness when universal would reduce jealousy and quarrels, reverence the spirits but keep them far off. Destiny decides to what class a man shall belong and as destiny is but another name for Nature, prayer is unnecessary for once having received his destiny a man can demand and obtain from Nature what he chooses—his own will determines all things.

Although not very successful in his lifetime so far as the rulers were concerned, Confucius had numerous disciples who collected his teachings which are found together with those of his later follower Mencius (372-289 B.C.) in the *Fu Cheng* (five classics) and the *Shih Shu* (four books) which contain the Analects. The Great Learning, The Doctrine of the Mean and the Book of Mencius. In time Confucianism became with Taoism and Buddhism one of the main religions in China. Unlike Buddhism it had little influence elsewhere.

Congregationalists the oldest sect of Nonconformists who hold that each church should be independent of external ecclesiastical authority. They took their origin from the Brownists of Elizabeth's days. Robert Browne (c. 1550-1633) an Anglican clergyman who had come to reject bishops was forced with his followers to seek refuge first in Holland and then in Scotland where he was imprisoned by the Kirk. In later life he changed his views and is disowned by Congregationalists because of his reversion to Anglicanism. His former views were spread by Henry Barrow and John Greenwood who under an Act passed in 1592 for the punishment of persons obstinately refusing to come to church (and largely designed for the suppression of this sect) were hanged at Tyburn. They had preached (a) that the only head of the church is Jesus Christ, (b) that contrary to Elizabethan doctrine the church had no relationship to the state, (c) that the only statute book was the Bible whereas the Articles of Religion and the Common Prayer were mere Acts of Parliament, (d) that each congregation of believers was independent and had the power of choosing its own ministers. The body fled once more to Holland and were among the Pilgrims who set sail in the *Mayflower* for America in 1620 whilst those who remained were joined by Puritans fleeing from Charles I. They became free once more to live in England under the Commonwealth only to be repressed again under Charles II. Finally full liberty of worship was granted under William III. In 1843 the Congregational Union of England and Wales was formed which has no legislative power. It has issued a Declaration of Faith by which no minister is bound, he is responsible to his own church and to nobody else. The sect is widespread both in Britain and the U.S.A. where it is held in special honour because of its connection with the Pilgrim Fathers.

Conservatism The name Conservative came into general use after 1834 in place of the older name of Tory although Tory democracy is now widely used to describe Conservative social reform policy. Originally the party of the aristocracy and landed gentry Conservatism has been supported from the end of the 19th cent. by the large business interests and more recently by lower income groups in the population. Although originally based upon the teachings of Burke and Disraeli Conservative doctrine has been considerably modified since 1945. The Conservatives increased their parliamentary strength in three successive general elections from 1951-59 but were defeated by Labour in 1964 and 1966. Contrary to all the findings of the pre-election polls this trend was reversed in 1970 when the Conserva-

tives reclaimed power with a substantial majority. On the continent Conservatism has generally been identified with fear of social progress exaggerated respect for authority and nationalism such parties have more often than not been extremely reactionary and anti democratic. *See also* Section C Part I

Coptic Church. the sect of Egyptian Christians who holding Monophysite opinions (i.e. refusing to grant the two natures God and Man of Christ) were declared heretical by the Council of Chalcedon in 451. They practise circumcision and have dietary laws. Their language is a direct descendant of ancient Egyptian. Like the Armenians they are regarded as an heretical branch of Eastern Christianity. Their religious head is the patriarch of Alexandria.

Cynics. a school of philosophy founded in the time of Alexander the Great by Diogenes. Choosing to live like a dog by rejecting all conventions of religion manners or decency and allegedly living in a tub Diogenes unwittingly brought on his school the title Cynic meaning not cynical as the word is understood today but canine. His teacher Antisthenes who had been a disciple of Socrates decided after the latter's death that all philosophy was useless quibbling and man's sole aim should be simple goodness. He believed in a return to nature despised luxury wanted no government no private property and associated with working men and slaves. Far from being cynics in the modern sense Diogenes and Antisthenes were virtuous anarchists rather like old Tolstoy (except that in the practice of their beliefs they were more consistent).

D

Darwinism. *See* Section F Part IV *See also* Vitalism.

Deism. *See* God and Man.

Demonism, Demons, and the Devil. Demons are ethereal beings of various degrees of significance and power which are believed to be implicated in men's good but especially evil, fortune. They are common to most cultures. From the anthropological point of view the demon arose as a widespread concept in the following ways (1) as a psychological projection into the outer world of man's own good or evil emotions and thoughts (2) as a survival of primitive animism (q.v.) thus spirits are believed to haunt places, trees, stones and other natural objects (3) when by warlike invasion the gods of the vanquished become the devils of the conquerors (as when the Jews occupied Canaan) (4) as a primitive belief that spirits of the dead continue after death to hover near their former habitation and not always entirely welcome to the living (5) the conception of a supreme source of evil (the Devil or Satan) which took shape among the Jews during their sojourn in Babylon under the influence of Zoroastrianism (q.v.) a religion in which the struggle between the two spirits Good and Evil reached its height in the imagination of the ancient world. The Satan of the Old Testament was first regarded as one of God's servants (in the Book of Job he goes up and down the earth to see whether God's commands are obeyed) but when the Jews returned from their captivity he had become identified with Ahirman the spirit of evil who was in continual conflict with Ahura Mazda, the spirit of good. As Dr. Margaret Murray has pointed out, the primitive mind ascribed both good and evil to one power alone, the distinction into God and the Devil priest and witch belongs to a higher stage of civilisation. The worship of evil itself or of its personification in Satan is a curious practice which seems to have developed hand in hand with Christianity and to have received steady support from a small but measurable minority. Many of the ceremonies involved in Satanism or in the so-called Black Mass appear to have been no more than opportunities for sexual excesses of one kind or another—such indulgences being traditionally barred to devout Christians. The alleged power of sex as a form of magic was propagated by the

talented but rather mad poet Aleister Crowley (1875-1947) who scandalised pre-war Europe with his very well publicised dabbings into Satanism. The self-styled wickedest man in the world Crowley was a pathetic rather than shocking figure and died a drug addict. He can hardly be said to have significantly advanced the cause of Demonology though it has to be admitted that he tried very hard. *See also* Witchcraft Magic.

Determinism and Free will. The question of whether man is or is not free to mould his own destiny is one which has exercised the minds of philosophers since Crete. mythology conceived of the Fates as weaving a web of destiny from which no man can free himself. Socrates (c. 470-399 B.C.) emphasised that man could through knowledge influence his destiny whilst ignorance made him the plaything of fate. Plato went further in pointing out that man can and does defeat the purposes of the universe and its divine Creator. It is our duty to live a good life but we can live a foolish and wicked one if we choose. Aristotle wrote: Virtue is a disposition or habit involving deliberate purpose or choice. If this were not so morality would be a sham.

The Problem for Theology. The last of the great philosophers of antiquity and one of the great influences in moulding Catholic theology was Plotinus (c. 204-270). Soul he taught is free but once enmeshed in the body loses its freedom in the life of sense. Nevertheless man is free to turn away from sensuality and towards God who is perfect freedom for even when incarnated in matter the soul does not entirely lose the ability to rescue itself. This conception was carried over into the beliefs of the Early Christian Apologists because it appeared to be in line with the teaching of Jesus that He had come to save man from sin. Sin implies guilt and guilt implies the freedom to act otherwise furthermore "an all good God cannot be responsible for the sin in the world which must be man's responsibility and thus again implies freedom. Pelagius (c. 355-c. 425) a Welsh priest not only believed in free will but questioning the doctrine of original sin said that when men act righteously it is through their own moral effort and God rewards them for their virtues in heaven. This belief became fairly widespread and was declared a heresy by the Church being attacked notably by St. Augustine (354-430) a contemporary of Pelagius who believed in predestination—that since the sin of Adam God had chosen who in all future history would be saved and who damned. This represents one tradition in Christianity—the determinism which leads to Calvinism (q.v.). St. Thomas Aquinas (1225-74) the greatest figure of scholasticism and one of the principal saints in the Roman Catholic Church, compromised between the two positions in the sense that believing man to be free, he yet held that Adam's sin was transmitted to all mankind and only divine grace can bring salvation. But even when God wishes to bestow this salvation, the human will must co-operate. God foresees that some will not accept the offer of grace and predestines them to eternal punishment.

The Problem for Philosophy. With the Renaissance thinkers began to free themselves from the domination of the Church and to study the world objectively and freely without preconceptions. But the more man turned to science the more he discovered that the world was ruled by apparently inexorable laws and, since the scientist must believe that every event has a cause he was led back to determinism. Man as part of the universe was subject to law too and all that existed was a vast machine. Francis Bacon (1561-1626) separated the fields of religion and science but left man subject completely to the will of God. Thomas Hobbes (1588-1679) was a rigid determinist and materialist although, having had trouble with the church in France whence as a royalist he had fled, he took care to announce that the Christian God is the Prime Mover.

Modern philosophy begins with René Descartes (1596-1650) a Frenchman who tried to reconcile the mechanical scientific universe of his time with the spiritual need for freedom

He did this by separating completely mind and body—the former he said is free the latter completely determined. But by admitting that the will can produce states of body he was left with the problem of how this could happen—a problem which the so called Occasionists solved to their own satisfaction by stating that the will is free and God so arranges the universe that what a person wills happens. Baruch Spinoza (1632-77) a Dutch Jew whose independence of thought had led to his excommunication from the Amsterdam Synagogue in 1656 was a complete determinist. He asserted that God and Nature are one everything that happens is a manifestation of God's inscrutable nature and it is logically impossible that things could be other than they are. Thus both Hobbes and Spinoza were determinists for entirely opposed reasons. The former as a materialist the latter because he believed in the absolute perfection and universality of God. Yet the great religious mystic and mathematician Blaise Pascal (1623-62) held that no matter what reason and cold logic may move we know from direct religious experience that we are free. John Calvin (1509-64) and Martin Luther (1483-1546) were both determinists. See Calvinism, Lutheranism.

To the more practical British philosophers John Locke (1632-1704) and David Hume (1711-76) free will was related to personality. Locke believed that God had implanted in each individual certain desires and these determine the will the desires are already there but we use our will to satisfy them. Hume argued that a man's behaviour is the necessary result of his character and if he had a different character he would act otherwise. Accordingly when a man's actions arise from his own nature and desires he is free. He is not free when external events compel him to act otherwise (e.g. if he strikes another because his own nature is such he is free as he is not if he is compelled to do so against his desire). Leibnitz (1646-1718) although as a German metaphysical philosopher holding very different general views said much the same thing—that choice is simply selecting the desire that is strongest. But most of the 18th cent. from Voltaire onwards with the great exceptions of Rousseau and the later German philosophers Kant Fichte Schopenhauer and Hegel who were initially influenced by him accepted determinism. Rousseau (1712-78) began to stem the tide by his declaration that man is a free soul striving to remain free and only prevented from being so by society and the cold science which stifles his feeling heart. Once again the will became important as Kant (1724-1804) asserted that belief in freedom is a moral necessity although it cannot be proved by reason. The moral nature of man shows that there is a transcendental world beyond the senses where freedom applies. Fichte and Schelling found freedom in the Absolute ego or God of whom each individual was part and thus also free. Hegel (1770-1831) saw the whole universe as evolving towards self awareness and freedom in man although this could only be fully realised in a society that makes for freedom. Even God himself only attains full consciousness and self realisation through the minds of such individuals as are free. This is the goal of the dialectical process (See Dialectical Materialism.)

The Scientist's View. For the scientist the law of cause and effect is a useful hypothesis since by and large it is necessary for him to assume that all events are caused. Nevertheless the modern tendency is to think in terms of statistical probability rather than relentless mechanistic causality and, although the free will problem does not concern the scientist as such, it is clear that freedom and determinism (assuming the terms to have any meaning at all) are not necessarily opposed in sociology. For example we know that certain actions will produce certain results upon the behaviour of people in general e.g. that raising the bank rate will discourage business expansion. But this does not mean that Mr Brown who decides in the circumstances not to add a new wing to his factory is not using his free-will. Even in the case of atoms as Dr Bronowski has pointed out the observed results of allowing gas under pres-

sure in a cylinder to rush out occur because most of the atoms are obeying the scientific law relating to such situations. But this does not mean that some atoms are not busy rushing across the stream or even against it—they are but the general tendency is outwards and that is what we note. Lastly the modern philosophical school of Logical Analysis would probably ask, not whether Free will or Determinism is the true belief but whether the question has any meaning. For what scientific experiment could we set up to prove one or the other true? The reader will note that some of the philosophers mentioned above are using the words to mean quite different concepts.

Dialectical Materialism, the combination of Hegel's dialectic method with a materialist philosophy produced by Karl Marx (1818-83) and his friend Friedrich Engels (1820-95). It is the philosophical basis of Marxism (q.v.) and Communism (q.v.). Dialectic—to the ancient Greek philosophers meant a kind of dialogue or conversation as used particularly by Socrates in which philosophical disputes were resolved by a series of successive contradictions, a thesis is put forward and the opposing side holds its contradiction or antithesis until in the course of argument a synthesis is reached in which the conflicting ideas are resolved.

From Thesis through Antithesis to Synthesis. Hegel in the 19th cent. put forward the view that this process applies to the course of nature and history as they strive towards the perfect state. But to him as to the Greeks the conflict was in the field of ideas. The universal reason behind events works through the ideas held by a particular society until they are challenged by those of another which supersedes them and in turn usually by war becomes the agent of universal reason until the arrival of a new challenger. Hegel therefore regarded war as an instrument of progress and his Prussian compatriots found no difficulty in identifying their own state as the new agent of progress by universal conquest. Feuerbach, Lassalle and other early socialists were impressed by some of Hegel's ideas e.g. that societies evolved (with the assumption that finally their own ideal society would be achieved) and that truth, morals and concepts were relative so that a type of society that was good at one time was not necessarily so at another. But Marx and Engels in effect turned Hegel upside down, accepted his dialectic but rejected his belief that ideas were the motive force. On the contrary they said ideas are determined by social and economic change as a result of materialistic forces (See Calvinism where it is pointed out that the Marxist view is not that Calvin changed men's economic ideas but rather that a developing capitalism unconsciously changed his). The historical materialism of Marxism purports to show that the inexorable dialectic determines that feudalism is displaced by capitalism and capitalism by creating a proletariat (its antithesis) inevitably leads to socialism and a classless society. The state as a tool of the dominant class, withers away. Dialectical materialism is applied in all spheres. As a philosophy there is little to be said for it save that it has shown us the close dependence of man's thoughts upon current material and social conditions. But as a battle-cry or a rationalisation of Marxism it wields immense power over the minds of men. See Marxism.

Dianetics See Scientology.

Diggers one of the many sects which flourished under the Commonwealth (others were the Muggletonians, the Levellers, the Millenarians and the Fifth Monarchy Men) so-called because they attempted to dig (i.e. cultivate) unimproved land. Gerrard Winstanley a profoundly religious man and leader of the Diggers believed in the economic and social equality of man and castigated the clergy for upholding the class structure of society. In his book *The True Leveller's Standard Advanced* (1649) he wrote: "Every day poor people are forced to work for fourpence a day though corn is dear. And yet the tithing priest stops their mouth and tells them that inward satisfaction of mind was meant by the declaration the poor shall in

heret the earth. I tell you the Scripture is to be really and materially fulfilled. You fear at the name Leveller. I tell you Jesus Christ is the Head Leveller.

Disciples of Christ a Protestant religious group founded in the United States early in the 19th century by Thomas Campbell a Scot, his son Alexander and Barton Warren Stone who had broken away from the Presbyterian church. The basis for faith and conduct is the Bible itself each individual interpreting it for himself. The group has always had a liberal reputation and stands for racial equality and Christian unity. The Disciples of Christ Church is particularly strong in the central and western states of America.

Doetists a Gnostic sect (q.v.) during the early centuries of Christianity who believed that since it was unworthy that the Son of God should have died a humiliating death on the cross the entity that was crucified was a mere phantom. Mohammed who believed in Jesus as a prophet but not as divine adopted these views. The heretical Albigenes were influenced by Doetism. Gnosticism and Manichaeism (q.v.).

Doukholders a religious sect of Russian origin founded by a Prussian sergeant at Kharkov in the middle of the 18th cent. and now mainly settled in Canada. Like many other sects they belong to that type of Christianity which seeks direct communication with God and such bodies tend to have certain traits in common such as belief in the inner light, opposition to war and authority in general and often ecstasies which show themselves in physical ways such as shaking (speaking in strange tongues (glossolalia) and other forms of what to the unbeliever seem mass hysteria. Liturgy ritual or ceremony is non-existent. The Doukholders were persecuted in Tsarist Russia but in 1898 Tolstoy used his influence to have them removed to Canada where the government granted them uninhabited land in what is now Saskatchewan and seven or eight thousand settled down in peace which they enjoyed for many years. Recently however their practices have caused difficulties once more for even the most tolerant government which is prepared to accept pacifism total dependence on communally owned agriculture refusal to engage in commerce non payment of taxes rejection of the marriage ceremony and separation when love ceases finds it difficult to tolerate as civilisation advances ever closer to Doukholder communities their proneness to put off these troublesome disguises which we wear - i.e. to walk about naked in the communities of their more orthodox neighbours. What the future of the Doukholders in their various sects (for even they have their differences) will be it is impossible to say but it is difficult to believe that these simple people can long resist the pressure of modern civilisation.

Dowsing See Radiesthesia.

Druidism the religion of Celtic Britain and Gaul of which Druids were the priesthood. They were finally wiped out by the Roman general Suetonius Paulinus about A.D. 68 in their last stronghold, the island of Anglesey. There are two sources of our present beliefs in Druidism (1) the brief and factual records of the Romans notably Pliny and Julius Caesar which tell us that they worshipped in sacred oak groves and presumably practised a religion doing reverence to the powers of nature which must have had its roots in early stone age times and had many cruel rites e.g. human sacrifices (2) the beliefs put forward by William Stukely an amateur antiquarian who from 1718 did valuable work by his studies of the stone circles at Stonehenge and Avebury. However influenced by the Romantic movement, he later put forward the most extravagant theories which unfortunately are those popularly accepted by those without archaeological knowledge today. Stonehenge and Avebury were depicted as the temples of the white haired Druid bard sublime and an attempt was made to tie up Druidism with early Christianity above all with the concept of the Trinity. In fact these circles have no connection with the Druids. They may have made ceremonial use of them but recent evidence suggests that the megalithic stones at Stone-

henge (L108) belong to a Bronze Age culture (1500-1500 B.C.). Nor have Druidism and Christianity any relationship. Almost nothing is known of the religion. Yet such were its romantic associations that even today one hears of Druidic ceremonies practised at the appropriate time of year on Brimstone Hill in the heart of London (though whether serious or with tongue in cheek one does not know). In Wales the name Druid survives as the title for the semi religious leaders of the annual festivals of Celtic poetry drama and music known as Eisteddfods. Lingering but now tenuous druidic connections are to be found in all Celtic parts including Cornwall and Britain where Eisteddfods are also held.

Dualism any philosophical or theological theory which implies that the universe has a double nature notably Plato's distinction between appearance and reality soul and body ideal and material objects reason and the evidence of the senses which infers that behind the world as we perceive it there lies an ideal world which is more real than that of mere appearance. In religions such as Zoroastrianism or the Gnostic and Manichaean heresies (q.v.) it was believed that the universe was ruled by good and evil principles - in effect that there was a good God and a bad one. In psychology dualism refers to the philosophical theories which believe mind and body to be separate entities. The opposite of dualism is monism which asserts the essential unity of the substance of the universe.

E

Ecumenism a world movement which springs from the Christian belief that all men are brothers and that the Christian Church should be re-structured to give reality to the belief that Christ's church exists not to serve its own members but for the service of the whole world. Some see the answer in a united church of a federal type (unity in diversity) others in an organic structure with one set of rules. The period since the convening of the Second Vatican Council by Pope John has been one of fervent discussion among Christian theologians with the aim of promoting Christian unity. See World Council of Churches.

Education Education was no great problem to primitive man but as societies became more complex people began to ask themselves such questions as *What* should young people be taught? *How* should they be taught? Should the aim of their education be to bring out their individual qualities or rather to make them good servants of the state?

The first teachers were priests who knew most about the traditions, customs, and lore of their societies and thus the first schools were in religious meeting places. This was notably true of the Jews who learned from the rabbis in the synagogue and throughout the Middle Ages in Christendom as will be seen later.

The Greeks We begin, as always with the Greeks whose city-states, based on slavery, educated men (not women) for the sort of life described in Plato's *Dialogues* - the leisured life of gentlemen arguing the problems of the universe at their banquets or in the market place. This made it necessary to learn debate and oratory (or rhetoric) especially for those who proposed to take up politics. The Sophist philosophy taught the need to build up convincing arguments in a persuasive manner to learn the rules of logic and master the laws and customs of the Athenians, and to know the literature of the past so that illustrations might be drawn from it. These strolling philosophers who taught for a fee were individualists showing the student how to advance himself at all costs within his community.

Socrates had a more ethical approach, believing that education was good in itself made a man happier and a better citizen, and emphasised his position as a member of a group. His method of teaching the dialectic or Socratic method involved argument and discussion rather than overwhelming others by rhetoric and is briefly

mentioned under *Dialectical Materialism* (q.v.) Today this method is increasingly used in adult education where a lecture is followed by a period of discussion in which both lecturer and audience participate for psychologists have shown that people accept ideas more readily when conviction arises through their own arguments than when they are passively thrust down their throats.

Socrates pupil Plato produced in his book *The Republic* one of the first comprehensive systems of education and vocational selection. Believing that men are of different and unequal abilities he considered that they should be put into social classes corresponding to these differences and suggested the following method.

(1) For the first 18 years of a boy's life he should be taught gymnastics and sports playing and singing music reading and writing and knowledge of literature and if he passed this course sent on to the next stage those who failed were to become tradesmen and merchants. (2) From 18-20 those successful in the first course were to be given two years of cadet training the ones thought incapable of further education being placed in the military class as soldiers. (3) The remainder who were to become the leaders of society proceeded with advanced studies in philosophy mathematics science and art. Such education was to be a state concern state supported and controlled selecting men and training them for service in the state according to their abilities.

Plato's pupil Aristotle even suggested that the state should determine shortly after birth which children should be allowed to live and destroy the physically or mentally handicapped this marriage should be state controlled to ensure desirable offspring. However in their time the leisured and individualistic Sophists held the field and few accepted the educational views of Plato or his pupil.

Rome The Romans were not philosophers and most of their culture came from Greece. Administration was their chief aptitude and Quintilian (A.D. c. 35-96) based his higher education on the earlier classical tuition in public speaking but he is important for emphasising the training of character and for his humanistic approach to the method of teaching that caused his *Institutio oratoria* to be influential for centuries later—indeed one might almost say up to the time of the great Dr Arnold of Rugby. Education he believed should begin early but one must take care that the child not old enough to love his studies does not come to hate them. By progressive foreign studies must be made pleasant and interesting and students encouraged by praise rather than discouraged when they sometimes fail. Play is to be approved of as a sign of a lively disposition and because gloomy depressed children are not likely to be good students corporal punishment should never be used because it is an insult as you will realise if you imagine it yourself. The world became interested not in *what* he taught but *how* he taught it he was the pioneer of humanistic education and character training from Vittorino da Feltré (1378-1446) of Mantua through Milton and Pope who commended his works to the modern educationists who have studied their pupils as well as their books.

The Middle Ages *The Religious View* With the development of Christianity education once more became a religious problem. The earliest converts had to be taught Christian doctrine and were given instruction in catechismal schools before admission to the group but as the religion came increasingly into contact with other religions or heresies a more serious training was necessary and from these newer catechetical schools where the method used was the catechism (i.e. question and answer as known to all Presbyterian children today) the Apologists arose among whom were Clement of Alexandria and the great Origen. From this time education became an instrument of the church and in 529 the Emperor Justinian ordered all pagan schools to be closed.

As typical of the best in mediaeval education whilst the lamp of civilisation burned low during the Dark Ages after the fall of Roman

power and survived only in the monasteries we may mention St. Benedict (c. 480-c. 547) of Monte Cassino. There in southern Italy a rule was established which became a part of monastic life in general. Monastic schools were originally intended for the training of would-be monks but later others were admitted who simply wanted some education thus two types of school developed one for the *interni* and the other for *externi* or external pupils. Originally studies were merely reading in order to study the Bible writing to copy the sacred books and sufficient calculation to be able to work out the advent of holy days or festivals. But by the end of the 6th cent. the seven liberal arts (grammar rhetoric dialectic arithmetic geometry music and astronomy) were added.

The Renaissance The close of the Middle Ages saw the development of two types of secular school. One came with the rise of the new merchant class and the skilled trader whose guilds or early trade unions established schools to train young men for their trades but ultimately gave rise to burgher or town schools the other was the court school founded and supported by the wealthy rulers of the Italian cities—Vittorino da Feltré (mentioned above) presided over the most famous at Mantua.

These Renaissance developments are paralleled in northern Europe by the Protestant reformers who having with Martin Luther held that everyone should know how to read his Bible in order to interpret it in his own way were logically committed to popular education compulsory and universal. In theory this was intended for biblical study but writing arithmetic and other elementary subjects were taught and Luther said that even if heaven and hell did not exist education was important. Universal education is a Protestant conception.

Views of Philosophers From this period on words people were free to put forward any ideas about education foolish or otherwise and to create their own types of school. Of English philosophers who theorised about but did not practice education we may mention the rationalist Francis Bacon (1561-1626) who saw learning as the dissipation of all prejudices and the collection of concrete facts the materialist and totalitarian Hobbes (1588-1679) who as a royalist believed that the right to determine the kind of education fit for his subjects is one of the absolute rights of the sovereign power or ruler the gentlemanly Locke (1632-1704) whose ideal was a sound mind in a sound body to be attained by hard physical exercise wide experience of the world and enough knowledge to meet the requirements of the pupil's environment. The end result would be one able to get on with his fellows pious but wise in the ways of the world independent and able to look after himself informed but reticent about his knowledge. Classics and religious study were not to be carried to excess since Locke held that these subjects had been overrated in the past. Locke's pupil was the well-to-do civilised young man of the 17th cent. who knew how to behave in society.

Jean Jacques Rousseau (1712-78) a forerunner of the Romantic movement (q.v.) which despised society and its institutions put emotion at a higher level than reason. His book *Emile* describes the education of a boy which is natural and spontaneous. Society he holds warps the growing mind and therefore the child should be protected from its influences until his development in accordance with his own nature is so complete that he cannot be harmed by it. During the first 4 years the body should be developed by physical training from 5 to 13 the child would live in a state of nature such that he could develop his powers of observation and his senses from 13 books would be used and intellectual training introduced although only in line with the child's own interests, and he would be given instruction only as he came to ask for it. Moral training and contact with his fellows to learn the principles of sympathy kindness and helpfulness to mankind would be given between 15 and 20. Girls, however, should be educated to serve men in a spirit of modesty and restraint. His own five children he deposited in a foundling hospital.

Summary Broadly speaking then there have been four main attitudes to education: (1) religious with a view to a life beyond death; (2) state controlled education with a view to uniform subservience to authority; (3) gentlemanly education with a view to social graces and easy congress in company; (4) the child-centred education which attempts to follow the pupil's inner nature. It is unnecessary to mention the ordinary method of attempting to instill facts without any considerable degree of co-operation between pupil and teacher in order that the former may with or without interest follow some occupation in adult life, for this, the philosophers did not consider. Today there remain the two fundamental principles: education for the advantage of the state and its ideology or education for individual development and freedom.

Four educationists of the modern period who have influenced us in the direction of freedom were Johann Pestalozzi of Switzerland (1746-1827) who by trying to understand children taught the natural progressive and harmonious development of all the powers and capacities of the human being; Friedrich Froebel (1782-1852) of Germany the founder of the Kindergarten who like Pestalozzi was influenced by Rousseau but realised the need to combine complete personal development with social adjustment; Maria Montessori (1869-1952) whose free methods have revolutionised infant teaching; John Dewey (1859-1952) who held that the best interests of the group are served when the individual develops his own particular talents and nature.

Eleatics the philosophers of Elea in ancient Greece who at the time when Heraclitus (c. 535-475 B.C.) was teaching that change is all that exists and nothing is permanent, were asserting that change is an illusion. Of the three leaders of this school, Xenophanes asserted that the universe was a solid unmovable mass forever the same. Parmenides explained away change as an inconceivable process, its appearance being due to the fact that what we see is unreal, and Zeno (the best known today) illustrated the same thesis with his famous argument of the arrow which at any given moment of its flight must be where it is since it cannot be where it is not. But if it is where it is it cannot move, this is based of course on the delusion that motion is discontinuous. The Eleatics were contemporaries of Socrates.

Empiricism. While not a single school of philosophy empiricism is an approach to knowledge which holds that if a man wants to know what the universe is like the only correct way to do so is to go and look for himself to collect facts which come to him through his senses. It is in essence the method of science as contrasted with rationalism (q.v.) which in philosophy implies that thinking or reasoning without necessarily referring to external observations can arrive at truth. Empiricism is typically an English attitude, for among the greatest empirical philosophers were John Locke, George Berkeley and David Hume. See Rationalism.

Epicureanism The two great schools of the Hellenistic period (i.e. the late Greek period beginning with the empire of Alexander the Great) were the Stoics and Epicureans the former founded by Zeno of Citium (not to be confused with Zeno the Eleatic) (q.v.) the latter by Epicurus born in Samos in 342 B.C. Both schools settled in Athens where Epicurus taught that pleasure is the beginning and end of a happy life. However he was no sensualist and emphasised the importance of moderation in all things because excesses would lead to pain instead of pleasure and the best of all pleasures were mental ones. Pleasures could be active or passive but the former contain an element of pain since they are the process of satisfying desires not yet satiated. The latter involving the absence of desire are the more pleasant. In fact, Epicurus in his personal life was more stoical than many Stoics and wrote "when I live on bread and water I spit on luxurious pleasures." He disapproved of sexual enjoyment and thought friendship one of the highest of all joys. A materialist who

accepted the atomic theory of Democritus he was not a determinist and if he did not disbelieve in the gods he regarded religion and the fear of death as the two primary sources of unhappiness.

Epiphenomenalism. See Mind and Body. **Erastianism**, the theory that the state has the right to decide the religion of its members wrongly attributed to Erastus of Switzerland (1524-34) who was believed to have held this doctrine. The term has usually been made use of in a derogatory sense—e.g. by the Scotch churches which held that the call of the congregation was the only way to elect ministers at a time when about the turn of the 17th and 18th cents. they felt that Episcopalianism was being foisted on them. **Episcopalianism** (i.e. Anglicanism) with its state church ecclesiastical hierarchy and system of livings presented by patrons was to them Erastian in addition to its other unscriptural practices.

Essenes a Jewish sect which during the oppressive rule of Herod (d. 4 B.C.) set up monastic communities in the region of the Dead Sea. They refused to be bound by the scriptural interpretations of the Pharisees and adhered rigorously to the letter of Holy Writ although with additions of their own which caused them by orthodox Jews today to be regarded as a break away from Judaism. Among their practices and beliefs were purification through baptism, renunciation of sexual pleasures, scrupulous cleanliness, strict observance of the Mosaic law, communal possession, asceticism. Akin in spirit although not necessarily identical with them were the writers of Apocalyptic literature preaching that the evils of the present world shortly be terminated by a new super-natural order heralded by a Messiah who would reign over a restored Israel. The casting out of demons and spiritual healing formed part of these general beliefs which were in the air at that time. The sect has an importance far beyond its size or what has been known about it in the past since the discovery from 1947 onwards of the Dead Sea Scrolls (see Section L) of the Qumran community occupying a monastery in the same area as the Essenes and holding the same type of belief. These scrolls with their references to a Teacher of Righteousness preceding the Messiah have obvious relevance to the sources of early Christianity and have given rise to speculations as to whether Jesus might have been influenced by views which, like His own, were unacceptable to orthodox Jews but in line with those of the Dead Sea communities. At the very least they seem to show that early Christianity was not a sudden development but a gradual one which had its predecessors.

Ethical Church, a movement typical of 19th cent. rationalism which attempted to combine atheism (or at any rate the absence of any belief in a God which was inconsistent with reason or based on revelation) with the inculcation of moral principles. Prayers were not used and ordinarily the service consisted in the singing of edifying compositions interspersed with readings from poems or prose of a similar nature by great writers holding appropriate views. It terminated in a talk on an ethical or scientific theme. There is an Ethical Church in London and the South Place Institution where Moncreaf Conway preached from 1864 to 1897 still exists.

Ethnocentrism, the exaggerated tendency to think the characteristics of one's own group or race superior to those of any others.

Evangelicalism, the belief of those Protestant sects which hold that the essence of the Gospel consists in the doctrine of salvation by faith in the atoning death of Christ and not by good works or the sacraments that worship should be free rather than liturgical through established forms that ritual is unacceptable and superstitious. Evangelicals are Low Churchmen.

Evangelism, the preaching of the Gospel, emphasising the necessity for a new birth or conversion. The evangelistic fervour of John Wesley and George Whitefield (see Methodism) aroused the great missionary spirit of the late 18th and 19th cent. George Fox, founder of the Society

of Friends (*qv*) was also an evangelist. Evangelists can be Low High or Middle Church men.

Existentialism, a highly subjective philosophy which many people connect with such names as Jean Paul Sartre (b 1903) or Albert Camus (1913-60) and assume to be a post war movement associated with disillusion and a sordid view of life. However existentialism stems from Soren Kierkegaard (1813-55) the Danish religious writer—his own description of him self—in such works as *Lily of the Fear and Trembling* and *Concluding Unscientific Postscript*. Between the two was translations of Kierkegaard into German influenced Martin Heidegger's (b 1889) great work *Being and Time* and the other great existentialist Karl Jaspers (b 1883) it has strongly influenced modern Protestant theology notably in Karl Barth Reinhold Niebuhr and Paul Tillich and beyond that field Gabriel Marcel (b 1887) the Spanish writer Unamuno (1864-1936) in his well known *The Tragic Sense of Life* and Martin Buber of Israel (b 1878) in his *I and Thou*. We have it on Heidegger's authority that Sartre is no philosopher even if it is his works that modern existentialists often turn.

Existentialism is extremely difficult for the non metaphysically minded to understand it deals not with the nature of the universe or what are ordinarily thought of as philosophical problems but describes an attitude to life or God held by the individual. Briefly its main essentials are (1) it distinguishes between *essence* i.e. that aspect of an entity which can be observed and known—and its *existence*—the fact of its having a place in a changing, and dangerous world which is what really matters (2) existence being basic each self aware individual can grasp his own existence on reflection in his own immediate experience of himself and his situation as a free being in the world what he finds is not merely a knowing self but a self that fears, hopes, believes, wills and is aware of its need to find a purpose, plan and destiny in life (3) but we cannot grasp our existence by thought alone thus the fact all men must die relates to the essence of man but it is necessary to be involved to draw the conclusion as a person that I too must die and experience its impact on our own individual existence (4) because of the preceding it is necessary to abandon our attitude of objectivity and theoretical detachment when faced by the problems relating to the ultimate purpose of our own life and the basis of our own conduct. Life remains closed to those who take no part in it because it can have no significance (5) it follows that the existentialist cannot be rationalist in his outlook for this is merely an escape into thought from the serious problems of existence none of the important aspects of life—failure, evil, sin, folly—nor (in the view of Kierkegaard) even the existence of God or the truth of Christianity—can be proved by reason.

God does not exist. He is eternal, was how he expressed it (6) life is short and limited in space and time, therefore it is foolish to discuss in a leisurely fashion matters of life or death as if there were all eternity to argue them in. It is necessary to make a leap into the unknown *eg.* accepting Christ (in the case of the Christian existentialist) by faith in the sense of giving and risking the self utterly. This means complete commitment not a dependence on arguments as to whether certain historical events did, or did not happen.

To summarise, existentialism of whatever type seems to the outsider to be an attitude to life concerning itself with the individual's ultimate problems (mine, not yours) to be anti-rationalist and anti-idealist (in the sense of being as it seems to the believer practical)—in effect it seems to say life is too short to fool about with argument you must dive in and become committed to something. Sartre who calls himself an atheist existentialist is apparently committed to the belief that hell is other people but for most critics the main argument against existentialist philosophy is that it often rests on a highly specialised personal experience and, as such is incommunicable.

Extra-sensory Perception See Telepathy

F

Fabian Society In 1848 (the year of *The Communist Manifesto* by Marx and Engels) Europe was in revolt. In most countries the workers and intellectuals started bloody revolutions against the feudal ruling classes which were no less violently suppressed hence on the continent socialism took on a Marxist tinge which to some extent it still retains. But at the same time England was undergoing a slow but non-violent transition in her political and industrial life which led the workers in general to look forward to progress through evolution. Marxism never became an important movement in England even though it took its origin here. There were many reasons for this: the agitation of the Chartists (*qv*) the writings of Mill, Ruskin and Carlyle, the reforms of Robert Owen, the religious movement led by the Wesleys, the Co-operative societies, the Christian socialists. Furthermore legislation stimulated by these bodies had led to an extension of the franchise to include a considerable number of wage earners, remedial measures to correct some of the worst abuses of the factory system, recognition of the trade unions etc.

This was the background against which the Fabian Society was founded in 1884 with the conviction that social change could be brought about by gradual parliamentary means. (The name is derived from Quintus Fabius Maximus the Roman general nicknamed Cunctator the delayer who achieved his successes in defending Rome against Hannibal by refusing to give direct battle.) It was a movement of brilliant intellectuals, chief among whom were Sidney and Beatrice Webb, H. G. Wells, G. B. Shaw, Graham Wallis, Sidney Olivier and Edward Pease. The Society itself was basically a research institution which furnished the intellectual information for social reform and supported all contributing to the gradual attainment by parliamentary means of socialism.

The Webbs's analysis of society emphasised that individual enterprise in capitalism was a hang over from early days and was bound to defeat itself since socialism is the inevitable accompaniment of modern industrialism, the necessary result of popular government is control of their economic system by the people themselves. Utopian schemes had been doomed to failure because they were based on the fallacy that society is static and that islands of utopias could be formed in the midst of an unchanging and antagonistic environment. On the contrary it was pointed out society develops.

The new becomes old often before it is consciously regarded as new. Social reorganisation cannot usefully be hastened by violent means but only through methods consonant with this natural historical progression—gradual, peaceful and democratic. The Fabians were convinced that men are rational enough to accept in their common interest developments which can be demonstrated as necessary. Thus public opinion will come to see that socialisation of the land and industries is essential in the same way that they came to accept the already existing acts in respect of housing, insurance, medical care and conditions of work. Gradual permeation of the power groups—trade unions, political parties, managers and enlightened employers—would speed the process.

The Society collaborated first in the formation of the Independent Labour Party and then with the more moderate Labour Party and the trade unions and Co-operative movement. But in general it disapproved of independent trade union action since change should come from the government and take political form. The class war of Marx was rejected and so too was the idea of the exclusive role of the working class—reform must come from the enlightened co-operation of all classes—not from their opposition.

Faculty Psychology a school of psychology basically belonging to the early 19th century which sought to explain mental phenomena by referring them to the activity of certain agencies or faculties such as memory, imagination, will, etc. as if they were entities in their own right.

rather than merely general terms for various groups of mental phenomena. Its most extreme form was phrenology (or) which found no less than thirty-seven so-called faculties.

Falangists. The Fascist Party of Spain founded in 1933 by José Antonio Primo de Rivera, son of the man who was dictator of the country from 1923 to 1930, he was shot by the Republicans. In 1937 the falangists who had shown unwelcome signs of social radicalism were merged with the other right wing political group, to form the *Fuero Español Tradicionalista y de las Juntas de Ofensiva Nacional Sindicalista* which replaced the Cortes (i.e. the Government) between 1939 and 1942 when the Cortes was re-instituted. The falange is the only political party allowed in Spain. See Fascism.

Fascism. From the end of mediæval times with the opening up of the world, the liberation of the mind and the release of business enterprise a new spirit arose in Europe exemplified in such movements as the Renaissance the Reformation the struggle for democracy the rise of capitalism and the Industrial Revolution. With these movements there developed a certain tradition which in spite of hindrances and disagreements or failures was universally held both by right and left wing parties however strongly they might fail to agree on the best means of attaining what was felt to be a universal ideal. The hard core of this tradition involved belief in reason and the possibility of human progress the essential sanctity and dignity of human life tolerance of widely different religious and political views reliance on popular government and the responsibility of the rulers to the ruled freedom of thought and criticism the necessity of universal education impartial justice and the rule of law the desirability of universal peace. Fascism was the negation of every aspect of this tradition and took pride in being so. Emotion took the place of reason the immutable beneficial and fruitful inequality of classes and the right of a self constituted élite to rule them replaced universal suffrage because absolute authority quick sure unanimous led to action rather than talk. Contrary opinions are not allowed and justice in the service of the state war is desirable to advance the power of the state and racial inequality made a dogma. Those who belong to the wrong religion, political party or race are outside the law.

The attacks on liberalism and exaltation of the state derive largely from Hegel and his German followers the mystical irrationalism from such 19th cent philosophers as Schopenhauer Nietzsche and Bergson from Sorel (see Syndicalism) came the idea of the myth, and an image which would have the power to arouse the emotions of the masses and from Sorel also the rationale of violence and justification of force. But these philosophical justifications of fascism do not explain why it arose at all and why it arose where it did—in Italy Germany and Spain. These countries had one thing in common—disillusionment. Germany had lost the 1914-18 war Italy had been on the winning side but was resentful about her small gains, Spain had sunk to the level of a third rate power and people were becoming increasingly restive under the reactionary powers of the Catholic Church the landed aristocracy and the army. In Marxist theory fascism is the last fling of the ruling class and the bourgeoisie in their attempt to hold down the workers.

Italian Fascism. The corporate state set up by Benito Mussolini in Italy claimed to be neither capitalist nor socialist and after its inception in 1922 the Fascist Party became the only recognised one. Its members wore black shirts, were organised in military formations, used the Roman greeting of the outstretched arm and adopted as their slogan 'Mussolini is always right'. Membership of the Party was not allowed to exceed a number thought to be suited to the optimum size of a governing class and new candidates were drawn after strict examinations, from the youth organisations. The Blackshirts, a fascist militia, existed separately from the army and were ruled by Fascist Headquarters.

At the head of government was Mussolini, I (80th Ed.)

Il Duce himself a cabinet of fourteen minister selected by him and approved by the King to supervise the various functions of government and the Grand Council or directorate of the Fascist Party all the members of which were chosen by the Duce. Parliament which was not allowed to initiate legislation but only to approve decrees from above consisted of a Senate with life membership and a Chamber of Fasci and Corporations composed of nominated members of the Party the National Council of Corporations and selected representatives of the employers and employees confederations. Private enterprise was encouraged and protected but rigidly controlled. Strikes were forbidden but a Charter of Labour enforced the collaboration of workers and employers whose disputes were settled in labour courts presided over by the Party. All decisions relating to industry were government controlled (e.g. wages, prices, conditions of employment and dismissal) the expansion or limitation of production and some industries such as mining shipping, and armaments were largely state owned.

Italian fascism served as a model in other countries notably for the German National Socialist Party in Spain and Japan and most European Nations between the wars had their small Fascist parties, the British version led by Sir Oswald Mosley being known as the British Union which relied on marches and violence. The Public Order Act of 1936 (see D45) was passed to deal with it. Although fascism in all countries has certain recognisable characteristics it would be wrong to think of it as an international movement taking fixed forms and with a clearly thought out rationale as in the case of communism. It is doubtful for example whether Japanese fascism was entitled to be described as such and the Spanish Falange differs in many respects both in outlook and origins from the German or Italian varieties. In fact the word fascist like bolshevik is often used as a purely emotive term of abuse. See Falange Nazism.

Fatalism. See Determinism.

Feedback Cult is the name given to a curious fad which began in America in 1970 and which is interesting because it incorporates complicated scientific equipment and experimental psychological methods into its practice. The basis of the cult is as follows: for nearly fifty years it has been known that the brain is the source of varied electrical signals of very low power which can be detected by attaching electrodes to the scalp and amplifying the pulses emitted. Much scientific controversy has surrounded these pulses and their interpretation by skilled clinicians can lead to the detection of hidden cerebral disorders such as tumours epileptic foci etc. The presence of one particular rhythm the so-called alpha wave which beats at 14 cycles per second—is believed to be dependent upon whether or not the individual is attending to something particularly in the visual field. It is this alpha rhythm, or rather its control that is the basis of the feedback cult.

Within the past decade it has been discovered that when some people are connected to an electroencephalograph (the device which records brain rhythms) and are shown the recorded tracings of their own brain waves as they actually occur they find it possible to modify and control the nature of the waves—the alpha in particular. This scientific curiosity rather than a major discovery soon caught the attention of followers of yoga and other systems seeking enhanced relaxation mental discipline etc. The argument was advanced that for centuries man had been seeking to exercise control over his own mental activities without however having much opportunity to assess his success—or lack of it. The use of the EEG with the individual's brain waves fed back to him for inspection would remedy this. The result has been a sudden surge of lay interest in electroencephalography and a boom in the sale of small portable EEG machines. Followers of the cult who may sit for hours inspecting the output from their own brains and attempting to modify it at will, claim that the activity promotes mental relaxation and a

greater and deeper understanding of their own personal problems. It is probably hardly necessary to say that psychologists are extremely dubious about the reality of this as mental therapy and the feedback cult will probably die away as soon as some new and equally attractive scientific toy is developed.

Fetichism originally a practice of the natives of West Africa and elsewhere of attributing magical properties to an object which was used as an amulet for putting spells on others or regarded as possessing dangerous powers. In psychology the term refers to a sexual perversion in which objects such as shoes, brassières, hair, etc. arouse sexual excitement.

Feudalism The feudal system took its origins from Saxon times and broadly speaking lasted until the end of the 18th cent. It was a military and political organisation based on land tenure for of course society throughout this period was based almost entirely on agriculture. The activities of men divided them into three classes or estates. The First Estate was the clergy responsible for man's spiritual needs, the Second was the nobility including kings and emperor as well as the lesser nobles, the Third was composed of all those who had to do with the economic and mainly agricultural life of Europe. The praying men, the fighting men and administrators and the toilers were all held to be dependent on each other in a web of mutual responsibilities.

The theory of feudalism although it by no means always worked out in practice was as follows: the earth was God's and therefore no man owned land in the modern sense of the word. God had given the pope spiritual charge of men and secular power over them to the emperor from whom kings held their kingdoms and in turn the dukes and counts received the land over which they held sway from the king. Members of the Second Estate held their lands on the condition of fulfilling certain obligations to their overlord and to the people living under them so when a noble received a fief or piece of land he became the vassal of the man who bestowed it. In turn he owed military service for a specified period of the year, attendance at court and giving his lord counsel. He undertook to ransom his lord when he fell into enemy hands and to contribute to his daughter's dowry and at the knighting of his son. In return the lord offered his vassal protection and justice, received the vassal's sons into his household and educated them for knighthood.

The system was complicated by the fact that large fiefs might be subdivided and abbots often governed church lands held in fief from nobles. The serf or tilling man dwelt on the land of a feudal noble or churchman where he rendered service by tilling the soil or carrying out his craft for his manorial lord in return for protection, justice and the security of his life and land. He was given a share in the common lands or pastures from which he provided for his own needs. In the modern sense he was not free (although at a later stage he could buy his freedom) since he was attached to the soil and could not leave without the lord's permission. On the other hand he could neither be deprived of his land nor lose his right of feudal tenure were abolished in England by statute in 1660 although they had for long been inoperative. In Japan a feudal system existed up to 1871. In Russia until 1917 and many relics of it still linger on (e.g. the *mezzadria* system of land tenure in parts of Italy).

Flying Saucers In June 1947 an American private pilot Kenneth Arnold saw a series of wingless objects flying through the air at a speed which he estimated at thousands of miles an hour. He later told the press that the objects flew as a saucer would if you skipped it across the water and the phrase 'flying saucers' was erroneously born. What Arnold actually saw has never been satisfactorily explained—it was probably a flight of jet fighters reflecting the sun's rays in a way that made them appear as discs—but since that date literally hundreds of thousands of people all over the world have reported the sighting of strange objects in the sky coming in a bewildering range of shapes and sizes. Initially the American Air Force

launched an official enquiry—Project Bluebook—to attempt to solve the mystery of these unidentified flying objects or UFOs which finally folded in 1960 after concluding that the bulk of the sightings were probably misinterpretations of natural phenomena and that there was no evidence for the commonly held view that earth was being visited by spacecraft from some other planetary system. A rather similar conclusion was arrived at by the famous University of Colorado project, the Condon Committee—which published its findings in 1968. Despite this clear cut official attitude belief in the existence of flying saucers and their origin as alien space vehicles is exceedingly widespread and is held very strongly by people in all walks of life. In 1959 this striking social phenomenon attracted the attention of the psychologist C. G. Jung. He noticed that the press were inclined to report statements that saucers existed when made by prominent people and not publish contrary statements made by equally prominent people. He concluded that flying saucers were in some way welcome phenomena and in his brilliant little book *Flying Saucers—a modern myth* he hypothesised that the UFOs were the modern equivalent of signs in the skies. It was Jung's contention that the saucers were looked upon as the harbingers of advanced alien civilisations who had come to save the world from its descent into nuclear catastrophe—archangels in modern dress in fact.

Whatever the validity of this imaginative view of UFOs it is undeniably true that they exercise a great fascination for millions of people some of whom invest them with genuine religious significance. The best example of the open incorporation of flying saucers into a religious belief system is to be found in the Aetherius Society, an international organisation with headquarters in Los Angeles but founded by a former London clerk George King. Mr King who claims to be the mediumistic link between earth and the largely benevolent beings from outer space regularly relays messages—notably from a Venusian known as Aetherius—to enthusiastic congregations at religious meetings. The sect which is entirely sincere and dedicated in its beliefs also makes pilgrimages to the tops of various mountains which have been spiritually charged with the aid of the spacebeings in their flying saucers.

Odd though such ideas may seem to most people they can be readily understood within the context of the very marked decline in orthodox religious belief which we have seen in the past two decades. To an increasing number of people many of whom feel a desperate need for spiritual guidance and enlightenment, the concepts of the traditionally Western religions seem somehow unsatisfactory. Many therefore turn to cults and splinter groups which use ideas and terminology which to them seem more at home in the twentieth century than those that sprang to life thousands of years ago. To members of the Aetherius Society for example the idea that Jesus Christ lives on Venus and rides around in a flying saucer is neither blasphemous nor ludicrous. As long as empty churches testify to the growing if perhaps only temporary loss of contact between orthodox religions and the man in the street then one can expect such offbeat ideas as the cults surrounding flying saucers and the science fiction like cult of Scientology (qv) to expand and flourish.

Fourism. See Utopianism.

Freemasonry a secret organisation with different systems in different countries. It shares with other secret societies the characteristics of being secret, having signs by which one fellow member can recognise another, initiation ceremonies, peculiar regalia and various grades of enlightenment. In England freemasonry was first organised in 1717 and in France and Germany in 1725 and 1737 respectively. Masons claim to be working for the good of mankind and carry out various charitable works. Many notable people are in the movement. Whatever their beliefs there can be no doubt that on the continent freemasons have intervened in politics and the organisation is banned by the Roman Catholic Church. Absurd attempts have been

made (and quite possibly are part of Masonic belief) to trace the society back to early and even Biblical times. Historically or course this is absurd nor have freemasons any connection with the masonic guilds of the Middle Ages which were intended for masons in the ordinary sense of the word.

In its early days and indeed until a decade or so ago membership of the freemasons conferred definite business and social advantages particularly in small communities where the leading middle class figures were generally members. Recently this advantage has markedly declined and freemason lodges nowadays tend to be little more than worthy charitable organisations. The publication by a number of disgruntled ex-masons of the full details of rituals initiation ceremonies regalia etc. has also tended to rob the movement of one of its greatest attractions—its role as an amiable secret society.

Freudian theory. See Psychoanalysis

Friends The Society of or Quakers a religious body founded in England in the 17th cent. by George Fox (1624-91). The essence of their faith is that every individual who believes has the power of direct communication with God who will guide him into the ways of truth. This power comes from the inner light of his own heart the light of Christ. Quakers meet for worship avoiding all ritual without ordained ministers or prepared sermons. There is complete silence until someone is moved by the Holy Spirit to utter his message.

In the early days Quakers gave vent to violent outbursts and disturbed church services. Friends had the habit of preaching at anyone who happened to be nearby. Their denunciation of steeple houses and references to the inner light, their addressing everyone as thees and thou, their refusal to go beyond yea and nay in making an assertion and refusing to go further in taking an oath must have played some part in bringing about the savage persecutions they were forced to endure. Many emigrated to Pennsylvania, founded by William Penn in 1682, and missionaries were sent to many parts of the world. The former violence gave way to gentleness. Friends not only refused to take part in war but even refused to resist personal violence. They took the lead in abolishing slavery, worked for prison reform and better education. As we know them today Quakers are quiet, sincere, undemonstrative people given to a somewhat serious turn of mind. The former peculiarities of custom and dress have been dropped and interpretation of the Scriptures is more liberal. Although Quakers refuse to take part in warfare, they are always ready to help the victims of war by organising relief, helping refugees in distress or sending their ambulance units into the heat of battle.

Fundamentalism is a term covering a number of religious movements which adhere with the utmost rigidity to orthodox tenets, for example the Old Testament statement that the earth was created by God in six days and six nights would be held to be factual rather than allegorical or symbolic. There is a strong minority underecurrent of support for various Fundamental religious including such sects as Jehovah's Witnesses, the Seventh Day Adventists etc. Although the holding of rigid beliefs in the literal truth of the Bible might seem to be frequently contrary to modern scientific findings the fundamentalists at least do not have the problems of compromise and interpretation to face, and among many simple minded and poorly educated people this is no doubt a great attraction.

G

Gestalt Psychology In the latter half of the 19th cent. it became evident to psychologists that in principle there was no good reason why mental events should not be just as measurable and manageable as physical ones. Intensive studies of learning, memory, perception, and so on were therefore undertaken and the begin-

nings of an empirical science of psychology were underway. In the early part of the 20th cent. the experiments of Pavlov (see Behaviourism) and his co-worker suggested that the behaviour of an animal or even man might ultimately be reduced to a descriptive account of the activities of nervous reflex loops—the so-called conditioned reflexes. With the publication of Watson's important book on Behaviourism in 1914 it looked as though the transfer of psychological studies from the field of philosophy to that of science could now take place. Actually, the over-simplified picture of cerebral and mental pictures which Behaviourism offered was rather comparable to the billiard ball view of the universe so fashionable in Victorian science. Just as Behaviourism implied that there was a fundamental building block (the conditioned reflex) from which all mental events could be constructed, so Victorian physics assumed that the entire universe could be described in terms of a vast collection of atoms pushing each other around like billiard balls. The development of nuclear physics was to shatter the latter dream and at the same time a challenge to the naive reflex psychology came from the Gestalt experimental school.

The founders of this school were Max Wertheimer, Kurt Koffka and Wolfgang Köhler, three young psychologists who in 1912 were conducting experiments—namely in vision—which seemed to expose the inadequacies of the behaviourist position. The Pavlov-Watson view as we have said implied that complex sensory events were no more than a numerical sum of individual nervous impulses. Wertheimer's group proposed that certain facts of perceptual experiences (ruled out of court as subjective and therefore unreliable by Watson) implied that *the whole (Gestalt) was something more than simply the sum of its parts*. For example the presentation of a number of photographs each slightly different in rapid series gives rise to cinematographic motion. In basic terms the eye has received a number of discrete still photographs and yet motion is perceived. What they asked was the sensory input corresponding to this motion? Some processes within the brain clearly added some thing to the total input as defined in behaviourist terms. An obvious alternative—in a different sense modality—is that of the arrangement of musical notes. A cluster of notes played one way might be called a tune, played backwards they may form another tune or may be meaningless. Yet in all cases the constituent parts are the same and yet their relationship to one another is evidently vital. Once again the whole is something more than the simple sum of the parts.

The implications of all this appeared to be that the brain was equipped with the capacity to organise sensory input in certain well defined ways and that far from being misleading and scientifically unjustifiable, human subjective studies of visual experience might reveal the very principles of organisation which the brain employs. Take a field of dots, more or less randomly distributed. Inspection of the field will soon reveal certain patterns or clusters standing out—the constellations in the night sky are a good illustration. There are many other examples and Wertheimer and his colleagues in a famous series of experiments made some effort to catalogue them and reduce them to a finite number of Laws of Perceptual Organisation which are still much quoted today.

The rise of the Gestalt school came as an inevitable balance to the behaviourist view point. But despite its undoubtedly descriptive merits and role in making psychology less simple if more realistic, Gestalt psychology never succeeded in the explanatory role for which much was hoped. Part of the difficulty perhaps was that its original theoretical slant seems to have been seriously off key. Wolfgang Köhler who was in fact a physicist as well as a psychologist, saw much in common between the forces of perceptual organisation in the brain and the constraining forces experienced in electromagnetic fields. It was known that the brain was a source of electrical energy so

why should it not be equipped with fields arising from the continuous basic neural activity? The search for permanent electrical fields in the brain continued unprofitably for decades until the devastating experimental work of Lashley (1951) who inserted gold leaf in various parts of the rat brain and showed no effect on learning or the retention of maze problems. Today Gestalt psychology is of historical rather than immediate interest, though its significance in the development of modern psychology is undeniable.

Gnosticism. Among the many heresies of early Christianity especially during its first two centuries was a group which came under the heading of Gnosticism. This was a system or set of systems which attempted to combine Christian beliefs with others derived from Oriental and Greek sources especially those which were of a mystical and metaphysical nature such as the doctrines of Plato and Pythagoras. There were many Gnostic sects the most celebrated being the Alexandrian school of Valentinus (fl. c. 130-c. 160). Gnosis was understood not as meaning knowledge or understanding as we understand these words but revelation. As in other mystical religions, the ultimate object was individual salvation. Sacraments took the most varied forms. Many who professed themselves Christians accepted Gnostic doctrines and even orthodox Christianity contains some elements of Gnostic mysticism. It was left to the bishops and theologians to decide at what point Gnosticism ceased to be orthodox and a difficult task this proved to be. Two of the greatest Clement of Alexandria and his pupil Origen unwittingly slipped into heresy when they tried to show that such men as Socrates and Plato who were in quest of truth were Christian in intention and by their lives and works had prepared the way for Christ. Thus they contradicted Church doctrine which specifically said *Extra ecclesiam nulla salus*—outside the Church there is no salvation.

God and Man. The idea of gods came before the idea of God and even earlier in the evolution of religious thought there existed belief in spirits (see **Animism**). It was only as a result of a long period of development that the notion of a universal God arose a development particularly well documented in the Old Testament. Here we are concerned only with the views of philosophers, the views of specific religious bodies being given under the appropriate headings.

First, however, some definitions. **Atheism** is the positive disbelief in the existence of a God. **Agosticism** (a term coined by T. H. Huxley the 19th cent. biologist and contemporary of Darwin) signifies that one cannot know whether God exists or not. **Deism** is the acceptance of the existence of God not through revelation, but as a hypothesis required by reason. **Theism** also accepts the existence of God, but unlike Deism does not reject the evidence of revelation (e.g. in the Bible or in the lives of the saints). **Pantheism** is the identification of God with all that exists (if *e* with the whole universe). **Monotheism** is the belief in one God. **Polytheism** the belief in many (see also **Dualism**).

Early Greek Views. Among the early Greek philosophers **Thales** (c. 624-555 B.C.) of Miletus, in Asia Minor. **Anaximander** (611-547 B.C.) his pupil, and **Anaximenes** (b. c. 570 B.C.) another Miletan were men of scientific curiosity and their speculations about the origin of the universe were untouched by religious thought. They founded the scientific tradition of critical discussion. **Heraclitus** of Ephesus (c. 540-475 B.C.) was concerned with the problem of change. How does a thing change and yet remain itself? For him all things are flames—processes. Everything is in flux and nothing is at rest. **Empedocles** of Agrigento in Sicily (c. 500-c. 430 B.C.) introduced the idea of opposition and affinity. All matter is composed of the so-called four elements—*earth water air and fire*—which are in opposition or alliance with each other. All these were materialist philosophers who sought to explain the working of the universe without recourse to the gods.

Socrates Plato and Aristotle. Socrates (470-

399 B.C.) was primarily concerned with ethical matters and conduct rather than the nature of the universe. For him goodness and virtue come from knowledge. He obeyed an inner voice and suffered death rather than give up his philosophy. He believed in the persistence of life after death and was essentially a monotheist. **Plato** (427-347 B.C.) was chiefly concerned with the nature of reality and thought in terms of absolute truths which were unchanging logical and mathematical. (See **Mind and Matter**.) **Aristotle** (384-322 B.C.) took his view of matter not from Democritus (atomic view) but from Empedocles (doctrine of four elements). A view which came to fit in well with orthodox mediaeval theology. Matter is conceived of as potentially alive and striving to attain its particular form being moved by divine spirit or mind (*nous*). (An acorn for example is matter which contains the form oak tree towards which it strives.) Thus there is a whole series from the simplest level of matter to the perfect living individual. But there must be a supreme source of all movement upon which the whole of Nature depends. A Being that Aristotle describes as the Unmoved Mover the ultimate cause of all being coming in the universe. This Being is pure intelligence a philosopher's God not a personal one. Unlike Plato Aristotle did not believe in survival after death holding that the divine that is the immortal element in man is mind.

Among the later Greek thinkers the Epicureans were polytheists whose gods, however, were purely supernatural powers. The Stoics built up a materialist theory of the universe based on the Aristotelian model. To them God was an all pervading force related to the world as the soul is related to the body but they conceived of it as material. They developed the mystical side of Plato's idealism and were much attracted by the astrology coming from Babylonia. They were pantheists. The Sceptics were agnostics.

From Pagan to Christian Thought. **Philo** the Jew of Alexandria, who was about 20 years older than Jesus, tried to show that the Jewish scriptures were in line with the best in Greek thought. He introduced the *Logos* as a bridge between the two systems. Philo's God is remote from the world, above and beyond all thought and being and as His perfection does not permit direct contact with matter the divine *Logos* acts as intermediary between God and man. **Plotinus** (204-70) a Roman, and the founder of Neoplatonism was the last of the great pagan philosophers. Like Philo he believed that God had created the world indirectly through emanations—beings coming from Him but not of Him. The world needs God but God does not need the world. Creation is a fall from God especially the human soul when enmeshed in the body and the world of the senses, yet (see **Determinism**) man has the ability to free himself from sense domination and turn towards God. Neoplatonism was the final stage of Greek thought drawing its inspiration from the mystical side of Plato's idealism and its ethics from Stoicism.

Christianity. **The Fathers and the Schoolmen.** It was mainly through St. Augustine (354-430) Bishop of Hippo in North Africa, that certain of the doctrines of Neoplatonism found their way into Christianity. Augustine also emphasised the concept of God as all good all wise all knowing, transcendent the Creator of the universe out of nothing. But he added since God knows everything everything is determined by Him forever. This is the doctrine of predestination and its subsequent history is discussed under **Determinism**.

In the early centuries of Christianity as we have seen some found it difficult to reconcile God's perfection with His creation of the universe and introduced the concept of the *Logos* which many identified with Christ. Further it came to be held that a power of divine origin permeated the universe namely the Holy Spirit or Holy Ghost. Some theory had to be worked out to explain the relationships of these three entities whence arose the conception of the Trinity. God is One but He is also Three.

Father Son (the *Logos* or Christ) and Holy Ghost

This doctrine was argued by the Apologists and the Modalists. The former maintained that the *Logos* and the Holy Spirit were emanations from God and that Jesus was the *Logos* in the form of a man. The Modalists held that all three Persons of the Trinity were God in three forms or modes. The *Logos* is God creating the Holy Spirit, God reasoning, and God is God being. This led to a long discussion as to whether the *Logos* was an emanation from God or God in another form. Was the *Logos* of like nature with God or of the same substance? This was resolved at the Council of Nicea (325) when Athanasius formulated the orthodox doctrine against Arians (*qv*) that the one Godhead is a Trinity of the same substance, three Persons of the same nature—Father Son, and Holy Ghost.

St. Thomas Aquinas (1227-74) influenced greatly by Aristotle's doctrines set the pattern for all subsequent Catholic belief even to the present time. He produced rational arguments for God's existence. *eg* Aristotle's argument that since movement exists there must be a prime mover, the Unmoved Mover or God. Further we can see that things in the universe are related in a scale from the less to the more complex from the less to the more perfect, and this leads us to suppose that at the peak there must be a Being with absolute perfection. God is the first and final cause of the universe absolutely perfect, the Creator of everything out of nothing. He reveals Himself in his Creation and rules the universe through His perfect will. How Aquinas dealt with the problem of predestination is told under Determinism.

Break with Mediaeval Thought Renaissance thinkers, free to think for themselves, doubted the validity of the arguments of the Schoolmen but were unwilling to give up the idea of God (nor would it have been safe to do so). Mystics (*see* Mysticism) or near mystics such as Nicholas of Cusa (*c* 1401-64) and Jacob Boehme (1575-1624) taught that God was not to be found by reason but was a fact of the immediate intuition of the mystical experience. Giordano Bruno held that God was immanent in the infinite universe. He is the unity of all opposites, a unity without opposites, which the human mind cannot grasp. Bruno was burned at the stake in 1600 at the instigation of the Inquisition (a body which, so we are told, never caused pain to anyone since it was the civil power, not the Inquisition, that carried out the unpleasant sentences) for his heresy.

Francis Bacon, who died in 1626, separated as was the tendency of that time, science from religion. The latter he divided into the two categories of natural and revealed theology. The former through the study of nature may give convincing proof of the existence of a God but nothing more. Of revealed theology he said: "we must quit the small vessel of human reason as we are obliged to obey the divine law though our will murmurs against it; so we are obliged to believe in the word of God, though our reason is shocked at it." Hobbes (*d* 1679) was a complete materialist and one feels that obedience to the notion was politic rather than from conviction. However he does mention God as starting the universe. In motion means that God is corporeal, but denies that His nature can be known.

From Descartes Onwards. Descartes (1596-1650) separated mind and body as different entities but believed that the existence of God could be deduced by the fact that the idea of him existed in the mind. Whatever God puts into man, including his ideas, must be real. God is self-caused, omniscient, omnipotent, eternal, all goodness and truth. But Descartes neglected to explain how mind separate from body can influence body or God separate from the world can influence matter.

Spinoza (1632-77) declared that all existence is embraced in one substance—God, the all-in-all. He was a pantheist and as such was rejected by his Jewish brethren. But Spinoza's God has neither personality nor consciousness, intelligence nor purpose, although all things follow in strict law from His nature. All the

thought of everyone in the world make up God's thoughts.

Bishop Berkeley (1685-1753) took the view that things exist only when they are perceived and this naturally implies that a tree for example ceases to exist when nobody is looking at it. This problem was solved to his own satisfaction by assuming that God seeing, everything prevented objects from disappearing when we were not present. The world is a creation of God but it is a spiritual or mental world not a material one.

Hume (1711-76) who was a sceptic held that human reason cannot demonstrate the existence of God and all past arguments to show that it could were fallacious. Yet we must believe in God since the basis of all hope, morality and society is based upon the belief. Kant (1724-1804) held a theory similar to that of Hume. We cannot know by reason that God exists, nor can we prove on the basis of argument anything about God. But we can form an idea of the whole of the universe, the one Absolute Whole and personify it. We need the idea of God on which to base our moral life although this idea of God is transcendent: *ie* goes beyond experience.

William James (1842-1910) the American philosopher (*qv* Pragmatism) held much the same view. God cannot be proved to exist but we have a will to believe which must be satisfied and the idea works in practice. Hegel (1770-1831) thought of God as a developing process beginning with the Absolute or First Cause and finding its highest expression in man's mind or reason. It is in man that God most clearly becomes aware of Himself. Finally Comte (1798-1857) the positivist held that religion belongs to a more primitive state of society and like many modern philosophers turned the problem over to believers as being none of the business of science.

Good and Evil.

Early Philosophers' Views. The early Greek philosophers were chiefly concerned with the laws of the universe consequently it was common belief that knowledge of these laws and living according to them, constituted the supreme good. Heraclitus, for example who taught that all things carried with them their opposites held that good and evil were like two notes in a harmony necessary to each other. It is the opposite which is good for us. Democritus, like Epicurus (*qv*) held that the main goal of life is happiness but happiness in moderation. The good man is not merely the one who does good but who always wants to do so. You can tell the good man not by his deeds alone but by his desires. Such goodness brings happiness the ultimate goal. On the other hand many of the wandering Sophist teachers taught that good was merely social convention, that there are no absolute principles of right and wrong, that each man should live according to his desires and make his own moral code. To Socrates knowledge was the highest good because doing wrong is the result of ignorance: no man is voluntarily bad. Plato and Aristotle differing in many other respects, drew attention to the fact that man is composed of three parts: his desires and appetites, his will, and his reason. A man whose reason rules his will and appetites is not only a good but a happy man. For happiness is not an aim in itself but a by-product of the good life. Aristotle, however emphasised the goal of self-realisation, and thought that if the goal of life is (as Plato had said) a rational attitude towards the feelings and desires, it needs to be further defined. Aristotle defined it as the Golden Mean—the good man is one who does not go to extremes, but balances one extreme against another. Thus courage is a mean between cowardice and foolhardiness. The later philosophers Philo and Plotinus held that evil was in the very nature of the body and its senses. Goodness could only be achieved by giving up the life of the senses and freed from the domination of the body turning to God, the source of goodness.

Christian Views. St. Augustine taught that everything in the universe is good. Even those things which appear evil are good in that

they fit with the harmony of the universe like shadows in a painting. Man should turn his back on the pleasures of the world and turn to the love of God. Peter Abelard (1079-1142) made the more sophisticated distinction when he suggested that the wrongness of an act lies not in the act itself but in the intention of the doer. God considers not what is done but in what spirit it is done and the merit or praise of the agent lies not in the deed but in the intention. If we do what we believe to be right we may err but we do not sin. The only sinful man is he who deliberately sets out to do what he knows to be wrong. St. Thomas Aquinas agreed with Aristotle in that he believed the highest good to be realisation of self as God has ordained and he also agreed with Abelard that intention is important. Even a good act is not good unless the doer intended it to have good consequences. Intention will not make a bad act good but it is the only thing that will make a good act genuinely good.

In general Christianity has had difficulties in solving the problem of the existence of evil, for even when one accepts that the evil men do is somehow tied up with the body it is still difficult to answer the question: how could an all good God create evil? This is answered in one of two ways: (a) that Adam was given free will and chose to sin (an answer which still does not explain how sin could exist anywhere in the universe of a God who created everything) (b) by denying the reality of evil as some Christians have chosen to do (e.g. Christian Science etc.). The Eastern religions on the other hand (see Zoroastrianism) solved the problem in a more realistic way by a dualism which denied that their gods were the creators of the whole universe and allowed the existence of at least two gods: one good and one evil. In Christianity there is of course a Devil but it is not explained whence his evil nature came.

Later Philosophic Views. Hobbes equated good with pleasure and evil with pain. They are relative to the individual man in the sense that one man's pain is another man's pleasure. Descartes believed that the power to distinguish between good and evil given by God to man is not complete so that man does evil through ignorance. We act with insufficient knowledge and on inadequate evidence. Locke believing that at birth the mind is a blank slate held that men get their opinions of right and wrong from their parents. By and large happiness is good and pain is evil. But men do not always agree over what is pleasurable and what not. Hence laws exist and these fall into three categories: (1) the divine law (2) civil laws (3) matters of opinion or reputation which are enforced by the fact that men do not like to incur the disapproval of their friends. We learn by experience that evil brings pain and good acts bring pleasure and basically one is good because not to be so would bring discomfort.

Kant (see God and Man) found moral beliefs to be inherent in man whether or not they can be proved by reason. There is a categorical imperative which makes us realise the validity of two universal laws: (1) always act in such a way that the maxim determining your conduct might well become a universal law; act so that you can will that everybody shall follow the principle of your action; (2) always act so as to treat humanity whether in thine own person or in that of another in every case as an end and never as a means.

Schopenhauer (1788-1860) was influenced by Buddhism and saw the will as a blind impelling striving and desire as the cause of all suffering. The remedy is to regard sympathy and pity as the basis of all morality and to deny one's individual will. This is made easier if we realise that everyone is part of the Universal Will and therefore the one against whom we are struggling is part of the same whole as ourselves.

John Stuart Mill and Jeremy Bentham were both representatives of the Utilitarian school believing that good is the greatest good (happiness) of the greatest number (see Utilitarianism). Lastly there is the view held mostly by political thinkers that good is what is good for the state or society in general (see State and Man).

Graphology the study of the analysis of human handwriting. There are two approaches to this topic and it is important to separate them clearly. The first involves the attempt on the part of an expert to decide from looking at a signature (a) to whom it belongs and (b) whether or not it is forged. This art is a legitimate though tricky area of study and graphologists have been called in as expert witnesses in courts of law. The second approach involves attempts to detect such tenuous variables as character from a study of an individual's handwriting, and this facts here are altogether less clear. Psychologists find it difficult enough to assess character or personality in a face to face interview and even when they are equipped with a range of special tests. The general opinion here would seem to be that some slight information might be revealed by a careful study of handwriting but that the overall effect would be too unreliable for this kind of graphology to be of practical value.

Guild Socialism a British form of syndicalism (q.v.) created in 1906 by an architect A. J. Penty who was soon joined by A. R. Orage, S. G. Hobson and G. D. H. Cole. The backbone to the movement was the situation that although at that time the Labour Party had 20 members in the House of Commons a period of severe economic crisis had shown the Government unwilling and the Labourites unable to do anything about it: the workers were resorting again to direct action to secure their demands and the democratic and constitutional methods to which the Fabians had partly persuaded them seemed to have failed. The guild socialists advocated a restoration of the medieval guild system as was being recommended by the French syndicalists whose programme involved a return to direct economic action: a functional industrial structure, return of craftsmanship and distrust of the state. Guild socialists believed that value was created by society as a whole rather than by individuals singly and that capitalist economists had recommended the accumulation of wealth without emphasising the social responsibilities which wealth should bring. The trade unions were to be organised to take over and run their own industries after nationalisation. Thus guild socialists were not only against capitalism but also against state socialism in which the state took over the control of industry. Political authority was held to be unengendered to human freedom and therefore nothing was to be gained by the substitution of state bureaucracy for capitalist control. The National Guilds League, formed in 1915, advocated the abolition of the wages system, self government in industry, control by a system of national guilds acting in conjunction with other functional democratic organisations in the community. This body was dissolved in 1925 but the theories of guild socialism have undoubtedly influenced British socialism.

H

Heresy originally meant a sect or school of thought holding views different from others (e.g. Pharisees and Sadducees within Judaism). Later it came to mean beliefs contrary to orthodox teaching (e.g. Arianism, Apollinarianism, Nestorianism).

Hinduism the religion and social institutions of the great majority of the people of India. Hinduism has no fixed scriptural canon but its doctrines are to be found in certain ancient works, notably the *Veda*, the *Brahmanas*, the *Upanishads* and the *Bhagavad gita*. The dark-skinned Dravidians invaded India between about 3250 and 2750 B.C. and established a civilisation in the Indus valley. They were polytheists who worshipped a number of nature gods, some elements of their beliefs persisted into Hinduism. They were subdued by a light-skinned Nordic people who invaded from Asia Minor and Iran about 1500 B.C. The language of these Aryan people was Vedic, parent of Sanskrit in which their religious literature (the Vedas) came to be written after many centuries of oral transmission.

The *Veda* or Sacred Lore has come down to us in the form of mantras or hymns of which there are four great collections: the best known being the *Ig Veda*. These Vedic Aryans worshipped nature deities, their favourites being Indra (rain), Agni (fire) and Surya (the sun). Their religion contained no idolatry but became contaminated by the more primitive beliefs of the conquered Dravidians. Sacrifice and ritual became predominant in a ceremonial religion.

As a reaction a more philosophic form arose (c. 600 B.C.) with its scriptures in the *Upanishads*. At its highest level known as Brahmanism belief is in a subtle and sophisticated form of monotheism (*Brahma* is an impersonal all-embracing spirit) but there is a tolerant acceptance of more primitive beliefs. Thus *Vimuta* (a conservative principle) and *Siva* (a destructive principle) grew out of Vedic concepts. The two great doctrines of Hinduism are *karma* and transmigration. The universal desire to be reunited with the absolute (the *Atman* or *Brahma*) can be satisfied by following the path of knowledge. Life is a cycle of lives (*samsara*) in which man's destiny is determined by his deeds (*karma*) from which he may seek release (*moksha*) through ascetic practices or the discipline of *yoga* (q.v.). Immense achievement means reincarnation—migration to a higher or lower form of life after death—until the ultimate goal of absorption in the absolute is reached.

In the great Sanskrit epic poems *Ramayana* and *Mahabharata* the deity takes three forms represented by the divine personalities of *Brahma*, *Vishnu* and *Siva*. There are also lower gods, demigods, supernatural beings and members of the trinity may even become incarnate as *Vishnu* became identified with *Krishna*, one of the heroes of the *Mahabharata* and the well known *Bhagavad gita*.

The ritual and legalistic side of Brahmanism is the caste system based on the elaborate code of the *Laws of Manu* according to which God created distinct order of men as He created distinct species of animals and plants. Men are born to be Brahmins, soldiers, agriculturists or servants, but since a Brahmin may marry a woman from any of these castes, an endless number of sub castes arises.

Hinduism has always shown great tolerance for varieties of belief and practice. Ideas pleasant and unpleasant have been assimilated. Fetichism, demon cults, animal worship, sexual cults (such as the rites of *Kali* in Calcutta). Today, as would be expected in a country which is in the throes of vast social change, Hinduism itself is changing. Under the impact of modern conditions new ideas are destroying old beliefs and customs. See also Jainism, Sikhism.

Humanism the term applied to (1) a system of education based on the Greek and Latin classics and (2) the vigorous attitude that accompanied the end of the Middle Ages and were represented at different periods by the Renaissance, the Reformation, the Industrial Revolution and the struggle for democracy. These include release from ecclesiastical authority, the liberation of the intellect, faith in progress, the belief that man himself can improve his own conditions without supernatural help and indeed has a duty to do so. Man is the measure of all things is the keynote of humanism. The humanist has faith in man's intellectual and spiritual resources not only to bring knowledge and understanding of the world but to solve the moral problems of how to use that knowledge. That man should show respect to man irrespective of class, race or creed is fundamental to the humanist attitude to life. Among the fundamental moral principles he would count those of freedom, justice and happiness.

Today the idea that people can live an honest, meaningful life without following a formal religious creed of some kind does not seem particularly shocking. It is an interesting gauge of the rapid change in social attitudes to religion that when less than twenty years ago the psychologist Margaret Knight tentatively advanced this thesis in a short B.B.C. talk, public opinion seemed to be outraged and both Mrs. Knight and the B.B.C. were openly

attacked by the popular press for immoral and seditious teachings.

The British Humanist Association condemns the religious clauses of the 1944 Education Act and wants compulsory religious instruction in schools abolished.

Humanity Religion of See Positivism

Hussites the followers of John Hus, the most famous pupil of John Wyclif. He was the rector of Prague University and although it is now by no means certain that his beliefs were heretical, he was condemned to death for heresy and burnt at the stake in 1415 at Constance whence he had come with a safe conduct issued by the Emperor Sigismund of Hungary. The latter based his action on the doctrine that no faith need be kept with heretics but it is obvious that the main objection to Hus was his contempt for authority of any kind. After their leader's death the Hussites became a formidable body in Bohemia and Moravia. They took up arms on behalf of their faith, their religion being strongly imbued with political feeling (hostility to Germanism and to the supremacy of the Roman Church). Their religious struggles for reform led to the Hussite War, during which the movement splintered into several groups.

I

Iconoclast Heresy In 726 the Byzantine Emperor Leo III forbade the use of images in church by Imperial decree—a decree which was continued intermittently until 843 when the heresy was abandoned. This was the Iconoclast controversy in which Emperor and Papacy were violently opposed. In the end the image worshippers triumphed and the sacred pictures (icons) have remained to this day. This ecclesiastical conflict between the Iconoclasts and the Papacy over a matter of ritual was the first of the crises which over three centuries were finally to bring about the schism between Orthodox Christendom and Western Christendom. Though temporary the supremacy of the State over the Church was nevertheless of supreme importance. Although the Iconoclast heresy is often given as the reason for the absence of statues in the Eastern Churches there is no evidence that they existed to any extent even before the movement began.

Idealism, in a philosophical sense the belief that there is no matter in the universe, that all that exists is mind or spirit. See Mind and Matter and Realism.

Immaculate Conception, one of the important dogmas concerning the Blessed Virgin Mary as taught by the Roman Catholic Church is that she was conceived and born without original sin (according to a bull of Pius IX 1854). Christians in general believe in the immaculate conception of Jesus Christ.

Immortality The belief in a life after death has been widely held since the earliest times. It has certainly not been universal, nor has it always taken a form which everyone would find satisfying. In the early stages of human history or prehistory everything contained a spirit (see Animism) and it is obvious from the objects left in early graves that the dead were expected to exist in some form after death. The experience of dreams too seemed to suggest to the unsophisticated that there was a part of man which could leave his body and wander elsewhere during sleep. In order to save space it will be helpful to classify the various types of belief which have existed in philosophical thought regarding this problem. (1) There is the idea that although something survives bodily death it is not necessarily eternal. Thus most primitive peoples were prepared to believe that man's spirit haunted the place around his grave and that food and drink should be set out for it, but that this spirit did not go on forever and gradually faded away. (2) The ancient Greeks and Hebrews believed for the most part that the souls of the dead went to a place of shades, there to pine for the world of men. Their wailing ghosts spent eternity in a dark, uninviting

region in misery and remorse. (3) Other people and there were many more of these believed in the transmigration of souls with the former life of the individual determining whether his next life would be at a higher or lower level. Sometimes this process seems to have been thought of as simply going on and on by others (e.g. in Hinduism and Buddhism) as terminating in either non-sentience or union with God but in any case in annihilation of the self as self-believers in this theory were the Greek philosophers Pythagoras, Empedocles, Plato (who believed that soul comes from God and strives to return to God according to his own rather confused notions of the deity. If it fails to free itself completely from the body it will sink lower and lower from one body to another). Plotinus held similar views to Plato and many other religious sects in addition to those mentioned have believed in transmigration. (4) The belief of Plato and Aristotle that if souls continue to exist after death there is no reason why they should not have existed before birth (this in part is covered by (3)) but some have pointed out that eternally does not mean from now on but the whole of time before and after now—nobody however so far as one knows held that individual souls so exist. (5) The theory that the soul does not exist at all and therefore immortality is meaningless—this was held by Anaximenes in early Greek times by Leucippus, Democritus and the other Greek atomists by the Epicureans from the Greek Epicurus to the Roman Lucretius by the British Hobbes and Hume by Comte of France and William James and John Dewey of America. (6) The thesis held notably by Locke and Kant that although we cannot prove the reality of soul and immortality by pure reason belief in them should be held for moral ends (For the orthodox Christian view see God and Man, Determinism and Free will). From this summary we can see that many philosophies and religions (with the important exceptions of Islam and Christianity) without denying a future life do deny the permanence of the individual soul in anything resembling its earthly form (see Spiritualism, Psychic research).

Imperialism, the practice by a country which has become a nation and embarked upon commercial and industrial expansion of acquiring and administering territories, inhabited by peoples usually at a lower stage of development as colonies or dependencies. Thus the 'typical' imperialist powers of the 19th cent and earlier were Britain, Belgium, Holland, Spain and Portugal whilst Germany, Italy and Japan which either did not have unity during this period or adequate industrial expansion tried to make good their lacks in this direction by war in the 20th cent. The term imperialism is not easy to define today (although often enough used as a term of abuse). There is economic imperialism exerted not through armies but through economic penetration. There is what may be described as ideological imperialism e.g. the anti-communist crusade that led America (in the name of freedom) into acts of appalling inhumanity in Vietnam, the dogmatism that led the Soviet Union into the invasion of Czechoslovakia. The Afrikaners in South Africa pass laws to permit the exploitation of the black and coloured peoples in their midst. Israel too whatever one may think of its creation on humanitarian grounds, is surely a piece of land taken from the Arabs who formed 90 per cent of its population by a people whose only rational claim is that their ancestors lived there two thousand years ago. Imperialism is a dangerous word and before using it we would do well to remember the rebort of a British statesman who when lecturing in America prior to Indian independence was asked by an elderly matron 'What are you going to do about the Indians?' 'Which Indians madam—ours or yours?'

Irrationalism An attitude that puts emotion and passion before reason.

Islam, the religion of which Mohammed (570-632) was the prophet, the word signifying submission to the will of God. It is one of the most widely spread of religions. Its adherents are called

Moslems or Muslims. Islam came later than the other great monotheistic religions (Judaism and Christianity) and may be regarded in some respects as a heresy. Mohammed accepted the inspiration of the Old Testament and claimed to be a successor to Moses and although he did not recognise Jesus as God he did recognise Him as a prophet (see Deceitism).

The sacred book of Islam is the Koran the most influential book in the world next to the Bible. According to Islamic belief the words were revealed to the prophet by God through the angel Gabriel at intervals over a period of 20 years first at his native Mecca and then at Medina. The book is divided into 114 *suras* or chapters all but one begin with the words

In the name of Allah the Merciful the Compassionate. It is written in classical Arabic and Moslems memorise much or all of it. The Koran superseded the Gospel as Mohammed superseded Christ. Its ethical teachings are high.

The great advantage of Mohammedism is that like orthodox Judaism it is a literal minded religion lived in everyday life. No Moslem is in any doubt as to exactly how he should carry on in the events of his day. He has five duties: (1) Once in his life he must say with absolute conviction There is no God but Allah and Mohammed is His Prophet. (2) Prayer preceded by ablution must be five times daily—on rising at noon in mid afternoon after sunset and before retiring. The face of the worshipper is turned in the direction of Mecca. (3) The giving of alms generously including provisions for the poor. (4) The keeping of the fast of Ramadan the holy month during which believers in good health may neither eat nor drink nor indulge in worldly pleasures between sunrise and sunset. (5) Once in his life a Moslem if he can must make the pilgrimage to Mecca. In addition, drinking gambling and the eating of pork are forbidden and circumcision is practised. Polygamy is permitted although decreasing sexual relations outside marriage are disapproved of marriage is only with the wife's consent and divorce may be initiated by either husband or wife. A great advantage in the spread of Islam has been its lack of race prejudices.

Mohammed's main achievements were the destruction of idolatry the welding of warring tribes into one community the progress of a conquest which led after his death to the great and cultured empire which spread throughout the Middle East into north Africa north India and ultimately to Spain. That it did not spread all over Europe was due to the Muslim defeat by Charles Martel at Tours in 732 A.D.

J

Jainism The Jains are a small Indian sect largely in commerce and finance numbering about 2 million. Their movement founded by Vardhamana called Mahavira (the great hero) in the 6th cent B.C. arose rather earlier than Buddhism in revolt against the ritualism and impersonality of Hinduism (q.v.). It rejects the authority of the early Hindu Vedas and does away with many of the Hindu deities whose place is largely taken by Jainism's twenty four immortal saints. It despises caste distinctions and modifies the two great Hindu doctrines of *karma* and transmigration. Jain philosophy is based on *ahimsa* the sacredness of all life regarding even plants as the brethren of man kind refusing to kill even the smallest insect. Jansenism, the name given by the Roman Catholic Church to the heresy of Cornelius Jansen (1585-1638) a Dutch born professor of theology at Louvain derived from his work *Augustinus* published after his death. This book set out to prove by a study of the works of St Augustine that Augustine's teachings on grace, predestination and free will (which, of course, Augustine denied) were opposed to Jesuit teaching. Already hostile to Jansen for forbidding them entry to Louvain university the Jesuits were outraged and in 1653 Pope Innocent V con-

demned five of Jansen's propositions as heretical. This produced one of the most famous controversies in history in which the secular and divine of the great convent of Port Royal in Paris defended the *Augustines* for which they were later expelled from their pos. Mean- while the great Pascal (1623-62) had taken up his pen in their defence and exposed Jesuit hypocrisy in his *Lettre Provinciales* one of the masterpieces of world literature for its brilliant phrasing, delicate irony and deadly quotation from Jesuit writings. The Letters had great influence filled the Jesuits with rage but even Pascal could not stop the cruel persecution which followed. Another Jansenist text book was published late in the century Queneau's *Moral Perfection of the New Testament* which Pope Clement XI in his bull *Unigenitus* condemned as heretical in 1713. The French Church was split from top to bottom the aged Louis XIV supported the bull and in 1720 it was made part of French law. Most Jansenists fled the country. Thus ended Jansenism in France but a small sect still exists in Holland Catholic in everything except acceptance of the *Trinitatis*.

Jehovah's Witnesses a religious body who consider themselves to be the present day representatives of a religious movement which has existed since Abel offered unto God a more excellent sacrifice than Cain by which he obtained witness that he was righteous Abel's witnesses were Noah and amongst others were Enoch Noah Abraham Moses Jeremiah and John the Baptist. Pre eminent among witnesses of course was Jesus Christ who is described in the Book of Revelation as the faithful and true witness. Thus they see themselves as the Lord's organisation in the long line of those who through the ages have preserved on earth the true and pure worship of God or as the Witnesses prefer to call Him Jehovah God.

So far as other people are aware the movement was founded by Charles Taze Russell (Pat. Russell) of Allegheny Pittsburgh Pennsylvania U.S.A. in 1881 under the name adopted in 1896 of the Watch Tower Bible and Tract Society which has continued as the controlling organisation of Jehovah's Witnesses. Its magazine *The Watch Tower Announcing Jehovah's Kingdom* first published in 1879 and other publications are distributed by the zealous members who carry out the house to house canvassing. The movement has a strong leadership.

Their teaching centres upon the early establishment of God's new world on earth pre-ceeded by the second coming of Christ. Witnesses believe this has already happened and that Armageddon will come as soon as the Witness is completed. The millennial period will give sinners a second chance of salvation and millions now living will never die (the title of one of their pamphlets).

The dead will progressively be raised to the new earth until all the vacant places left after Armageddon are filled. There is however some doubt about the goatish souls who have made themselves unpleasant to the Witnesses those who have accepted (or permitted to be accepted) a blood transfusion contrary to the Scriptures and others who have committed grave sins.

Every belief held by the movement is claimed can be upheld, chapter and verse by reference to the Scriptures. Witnesses regard the doctrine of the Trinity as devised by Satan. In both wars Witnesses have been in trouble for their refusal to take part in war and it is only fair to add that six thousand suffered for the same reason in German concentration camps.

Judaism the religion of the Jews the oldest of the great monotheist religions parent of Christianity and Islam, the development of which is presented in the Old Testament. The creed of Judaism is based on the concept of a transcendent and omnipotent One True God the revelation of His will in the *Torah* and the special relation between God and His Chosen People. The idea of Incarnation is rejected, Jesus is not recognised as the Messiah. The *Torah* is the Hebrew name for the Law of Moses (the Pentateuch) which Judaism holds was divinely revealed to Moses on Mount Sinai soon after

the exodus of the Israelites from Egypt (1230 B.C.). Many critics deny the Mosaic authorship of the first five books of the Bible and believe them to be a compilation from four main sources known as J (Jahvist) E (Elohist) D (Deuteronomist) and P (Priestly Code) distinguished from each other by the name used for God language style and internal evidence. From the historical point of view an important influence on Judaism may have been the monotheism of Ishmael the heretic Pharaoh (note for example the derivation of Psalm 104 from Ishmael's Hymn to the Sun).

The Talmud is a book containing the oral and canonical law of the Jew and includes the Mishna a compilation from oral tradition written in Hebrew and the Gemara a collection of comments and criticisms by the Jewish rabbis written in Aramaic. There are in all two Talmuds the one made in Palestine (the Jerusalem Talmud) finished at the beginning of the 4th cent and the other made in Babylon completed at the end of the 6th cent.

Judaism at the beginning of the Christian era had a number of sects. (1) the Pharisee whose views include the first clear statement of the resurrection of the just to eternal life and the future punishment of the wicked who held to the *Torah* and the universality of God. (2) the Sadducees the upper class of priests and wealthy landowners to whom God was essentially a national God and who placed the interests of the state before the *Torah* they rejected ideas of resurrection and eternal life. (3) the Essenes (q.v.) who were regarded as a puritanical break away movement by both parties. The views of the Pharisees prevailed.

Jewish writing continued through the years and some books were added to the *Torah* among them the Three Major Prophets and certain books of the Twelve Minor Prophets. There were also the Apocalyptic writers who were unorthodox in their preaching of a divinely planned cataclysmic end to the world with a new Heaven and new earth preceded by a divine Messiah and a future life—all of which beliefs influenced early Christianity. Judah Halevi of Toledo (c. 1055-c. 1140) and Moses Maimonides of Cordova (1135-1204) were the great Jewish philosophers.

Modern movements in Judaism stem from the Enlightenment notably with Moses Mendelssohn in the 18th cent. who accepted as war the tendency of the period, only that which could be proved by reason. He translated the Pentateuch into German thus encouraging German Jews to give up Yiddish and Hebrew for the language of the land and thereby preparing them for their vast contribution to Western civilisation. One of his disciples, David Friedländer (d. 1834) instituted reform Judaism behind which lay the desire for assimilation. He wanted to eliminate anything that would hamper the relationships of Jews with their neighbours or tend to call in doubt their loyalty to their adopted state. A similar movement in America (1886) called for the rejection of dietary laws the inauguration of Sunday services and the repudiation of Jewish nationalism. Between reform and orthodoxy there arose the conservative movement which in England includes prayers in English in the service does not segregate men and women in the synagogue and translates the Law in a more liberal way. (The fact is that it would be almost impossible for a strictly orthodox Jew to live in a modern industrialised community at all).

Judaism is essentially a social and family religion which, more than almost any other concerns itself with the observances of every aspect of daily life. As in Islam (q.v.) details are laid down in the most minute way for the behaviour of the orthodox.

The home is the main Jewish institution and Jews like Catholics, cannot surrender their religion. Circumcision takes place eight days after birth and a boy becomes a man for religious purposes at his Bar Mitzvah at the age of thirteen. Women are spared most of this because their place in the home is considered sufficiently sacred. Among festivals are Passover recalling the Exodus Rosh Hashanah (the Jewish New Year) the anniversary of the

Creation and the beginning of ten days of penitence ending with Yom Kippur (the Day of Atonement), a day of fasting spent in the synagogue. Purnim, celebrating the deliverance of the Jews from Haman and Chanukah celebrating their victory against the Syrians under their leader Judas Maccabean. A new and semi religious festival is the Yom Haatzmaut the anniversary of the birth of the new Jewish state of Israel.

K

Karma See Buddhism, Hinduism

Ku Klux Klan After the American Civil War (1861-65) southern conservatives and ex Confederate leaders began to fear (as they had every reason to do) both Negro and poor White rule. Taxes were rising owing to radical legislation and the tax burdened and disenfranchised planters finally took to illegal means to achieve their ends by trying to effect an alliance with the poor White and small farmer through appealing to his anti Negro prejudice.

Hence the Ku Klux Klan was formed in 1866 as a secret society by a small group of Confederate veterans in Tennessee with the intention of frightening Negroes by dressing in ghostly white robes in the guise of the spirits of dead soldiers. But the movement spread like wild fire throughout the South encouraged by small farmers and planters alike. General Nathan Bedford Forrest was appointed Grand Wizard of the Klan empire and in every community armed Klansmen rode at night horsewhipped uppity Negroes beat Union soldiers and threatened carpet bag politicians (i.e. fortune hunters from the North). Soon several similar organisations arose many of which did not stop at torture, burning property and murder. In fact although claiming to be a holy crusade the Klan was a ruthless and contemptible organisation in which former Southern leaders tried to regain control deliberately set poor and middle class Whites against the Negroes by appeal to race prejudice. Congress struck back with laws and intervention of federal troops and after a large number of convictions in South Carolina much of the violence stopped even if the feelings continued.

After the 1914-18 war the movement dormant since 1900 revived as a sadistic anti Negro and Jewish, anti Catholic society spreading to the north as well as the south. By 1926 with its white gowned hoodlums and fiery crosses the Klan began to subside once more. But it rose again after the second world war. After some cruel racial murders in Alabama during 1944-5 President Johnson denounced K K K terrorism and promised new criminal legislation to deal with the Klan.

Kuomintang A Chinese Nationalist party founded in 1891 by Sun Yat Sen. It took part in the first Chinese revolution of 1911 and led the second the following year dominating south China by 1920 and, under Chiang Kai shek, who succeeded Sun Yat Sen on his death in 1925, conducted China's defence against Japanese invasion from 1937-45. Sun Yat Sen had attempted to found a democratic republic based on Western parliamentary democracy and in his famous *24-point* laid down the principles upon which the constitution of China should be based. In 1946 Sun Fo the son of Sun Yat Sen deplored the party's departure from the principles of social democracy and the welfare of the people in which his father had believed. Beginning as a movement largely inspired by Russia the Kuomintang under Chiang Kai shek degenerated into a reactionary and corrupt military oligarchy which collapsing in 1949 was replaced by the Communist party leaving Chiang and his followers to rule Formosa with American aid.

L

Lamaism, the religion of Tibet. Its beliefs and worship derive from the Mahayana form of

Buddhism which was introduced into Tibet in 749 A.D. The emphasis laid by its founder on the necessity for self discipline and conversion through meditation and the study of philosophy deteriorated into formal monasticism and ritualism. The Dalai Lama as the reincarnated Buddha was both king and high priest, a sort of pope and emperor rolled into one. Under him was a hierarchy of officials in which the lowest order was that of the monks who became as numerous as one man in every six or seven of the population. The main work carried out by this vast church state was the collection of taxes to maintain the monasteries and other religious offices. Second in power to the Dalai Lama was the Panchen or Tashi Lama, believed to be a reincarnation of Amitabha, another Buddha. The last Dalai Lama fled to India in 1959 when the Chinese entered his country. For a brief period following his departure the Panchen Lama surprised the Western world by publicly welcoming the Communist invasion. How much of this was due to coercion at the time is not clear but he later renounced the regime and the suppression of Lamaism in Tibet continued unchecked.

Latitudinarians Anglican churchmen or exceedingly broad views (e.g. bishops who would admit dissenters—i.e. those rejecting the views or authority of the Established Church). Although still used today the term applies especially to such eminent 17th cent. divines as Burnet, Hales, Tillotson and Chillingworth.

Lieveland an English military politico religious party prominent in the Parliamentary Army about 1847 which stood for the rights of the people. See Diggers.

Liberalism The Liberal Party is the successor to the Whigs (a nickname derived from *whigga more* used in the 17th cent. for Scottish dissenters) of the 18th and 19th cent. Prior to the victory of the Labour Party in 1922 it was one of the two main British political parties. Liberals are moderately progressive in the sense that most appreciate the humanitarian aspects of socialism while strongly disapproving of its policies of state control and they dislike any form of monopoly state run or otherwise. In general the Party advocates co ownership in industry, electoral reform (proportional representation), protection of individual liberties, governmental reform, tax reform, strict measures against any form of monopoly and separate parliaments for Scotland and Wales.

Logic Positivism, a school of philosophy founded in Vienna in the 1920s by a group known as the Vienna circle, their work was based on that of Ernst Mach but dates in essentials as far back as Hume. Of the leaders of the group Schlick was murdered by a student. Wittgenstein came to Britain and Carnap went to America following the entry of the Nazis. Briefly the philosophy differs from all others in that while most people have believed that a statement might be (a) true or (b) false logical positivists consider there to be a third category, a statement may be meaningless. There are only two types of statement which can be said to have meaning: (1) those which are tautological, i.e. those in which the statement is merely a definition of the subject such as a triangle is a three sided plane figure (triangle and three sided plane figure are the same thing) and (2) those which can be tested by sense experience. This definition of meaningfulness excludes a great deal of what has previously been thought to be the field of philosophy in particular it excludes the possibility of metaphysics. Thus the question as to whether there is a God or whether free will exists is strictly meaningless for it is neither a tautological statement nor can it be tested by sense experience.

Lollards a body of religious reformers and followers of Wyclif who were reviled and persecuted in the reign of Richard II. The name Lollard comes from the old English word meaning 'mutterer'—a term of contempt used to describe the sect. Henry IV renewed his father's persecution of the group even condemning one of his own personal friends the Lollard leader Sir John Oldcastle to be burnt at the stake.

Luddites a group of peasants and working men

who deliberately destroyed spinning and farm machinery in England in the early part of the 19th cent. fearing that such devices would destroy their livelihood. Their name was taken from the eccentric Ned Lud who had done the same in a less organized way two or three decades earlier. The Luddites' worst fears were of course not realised, for far from putting human beings out of work the industrial revolution created jobs for a vastly increased population. Luddism dormant for over a century is beginning to appear again if in muted form. Public anxiety about the rapid growth in computer technology is manifesting itself in the form of such groups as the Society for the Abolition of Data Processing Machines which while not of course dedicated to the physical destruction of computers urge for social and even governmental checks on the development of such things as data banks. These are vast computer memory stores listing comprehensive records concerning all the people living in a city or country and able to cross reference them in a way that has never previously been possible. The arguments for and against such data banks and other developments in computer technology are beyond the scope of this section but the rise of this 20th cent. Luddism is of considerable historical and social significance.

Lutheranism. The Reformation had a long history before it became under Luther and Calvin, an accepted fact. The medieval Church had held (as the Catholic Church holds today) that the sacraments were the indispensable means of salvation. Since these were exclusively administered by the clergy any movement which attacked clerical abuses was forced by sheer necessity to deny the Church's exclusive control of the means of salvation before it could become free from dependence on a corrupt priesthood. Hence the Albigenses and the Waldenses (q.v.), the followers of John Hus and Wyclif (see Anticlericalism) were bound to deny the authority of the Church and emphasise that of the Bible. Luther began his movement primarily in order to reform the Church from its gross abuses and the famous ninety five theses nailed to the door of the Church at Wittenberg in 1517 were not primarily theological but moral complaints dealing with the actual behaviour of the clergy rather than Church beliefs. But unlike the earlier reformers, Luther had arrived at the right moment in history when economic individualism and the force of nationalism were bound, sooner or later to cause the authorities in Germany to line up on his side. Thus he began with the support of the peasants who were genuinely shocked at the abuse of indulgences and other matters, but ended up by being supported by the noblemen who wanted to destroy the power of the pope over the German states and looked forward to confiscating the lands and property of the Church. When the peasants wanted the reform of actual economic abuses relating to the feudal system, Luther took the side of the nobles against them. The contemporary movement in Switzerland led by Ulrich Zwingli had no such secular support and Zwingli was killed in 1531.

Martin Luther (1483-1546) was the son of a miner in Eisenberg in Saxony entered the order of Austin Friars in 1505 and later taught at the newly founded university of Wittenberg. After the publication of the theses the real issue so far as the Church was concerned was whether he was willing or not to submit to the authority of his superiors. Luther refused to compromise with his conscience in the famous words: Here I stand. I can do no other. In a further statement Luther recommended the formation of a German national church the abolition of indulgences and other means whereby Rome obtained money from Germany and an end to the celibacy of the clergy. For this he was naturally excommunicated. His teaching was based on the German translation of the Bible, but he was by no means a fundamentalist, e.g. he denied that the Book of Hebrews was written by Paul, would have nothing to do with the Apocalypse, and regarded the letter of James as an epistle of straw. The Scriptures were open to all and could be interpreted by private judgment enlightened by the Spirit of God.

Like Calvin Luther was a predestinarian and determinist but he was also a conservative and soon became alarmed about the position taken by many extremists once the Reformation was under way. He had really wanted the Church to reform itself but when he alienated Rome he had perforce to rely more and more on the secular powers which finally resulted in the state church form which became pronounced in Prussia and later elsewhere. Whereas Calvin wished the Church to be at least the equal of the State and in some respects its superior Luther's rebellion resulted in the reverse a state controlled episcopalianism. See Calvinism Presbyterianism.

M

McLuhanism. The name of Marshall McLuhan came into wide prominence in Britain about 1967. What is McLuhanism? Or rather what are the aspects of the unusual explorations of this Canadian professor whose three books appeared in this country at about the same time to make such an effective impact? The titles of the books are *The Mechanical Bride* (1951) *The Gutenberg Galaxy* (1962) and *Understanding Media* (1964). McLuhan pours out his ideas about the whole process of communication as it has extended mankind's horizons and therefore mankind himself from the invention of movable type up to and through the mechanical age. We are in the midst of a revolution right now with vast sociological and technological changes and we have not yet attained a language to match our need for communication in the new electronic age. It is the form of the new media—radio, television, films and so on—which affects our patterns of human association rather than the contents. Hence the phrase: the medium is the message. It is therefore McLuhan's purpose to understand the social changes brought about by all these media which cut side the body and outside the brain, are extensions of oneself—the telephone, photography, record players, radio, T.V. computers and so on. All these are wielding a power over us beyond our control and McLuhan turns his sardonic witty epigrammatic eye and pen on the new cryptic, changing Electronic Man. McLuhan is a joker all right but a very original one, and underneath the compelling and allusive wit are seams of sense still to be explored as time goes on. The idea of *The Gutenberg Galaxy* is in essence that there have been two great turning points in human understanding since man learnt to read and write: the invention of the printed book and now the present electronic revolution. The old linear logical method of thought and expression affected areas of our activity beyond what are normally associated with printing or even language now too the present transformation is changing civilisation in a way still to be assessed, with profound and unsuspected changes in attitudes and thinking. We are being tightened up into a "global village," information flooding in to us from everywhere in unmanageable quantities time and space being annihilated. There seems nothing which will not be affected, our personalities, the relations between individuals and between communities, war, crime, race, religion, literature everything. Like a boxer McLuhan jabs this way and that with an aphorism here and an epigram there and allusions all the time. In a whirling attack on so many things about which we have grown comfortable and complacent, we are drawn in to construe the exciting messages from the frontier of a new and exciting age.

Magic, a form of belief originating in very early days and based on the primitive inability to distinguish between similarity and identity. The simplest example would perhaps be the fertility rites in which it is believed that a ceremony involving sexual relations between men and women will bring about fertility in the harvest. Or the idea that sticking pins in an image of an individual will bring about harm

or even death to the real person. Magic is regarded by some as a form of early science in that man in his efforts to control Nature had recourse to magical practices when the only methods he knew had failed to bring the desired results. It filled a gap. By others magic is regarded as an elementary stage in the evolution of religion. It can be said to have served a purpose there too. Yet magic differs from religion however closely at times it may come to be related with it in this important respect: religion depends upon a power *outside and beyond* human beings whereas magic depends upon nothing but the casting of a spell or the performance of a ceremony—the result follows automatically. (We do well as Dr Margaret Muri to remind us to keep in mind that when anything regarded as out of the ordinary course of nature is brought about by human means it is called a miracle if the magician belongs to the beneficiary's own religion but it is magic—often black magic—if the wizard belongs to another religion. In Grimm's words: "Miracle is divine Magic is devilish.")

The idea that like produces like is at the root of imitative magic and it is interesting to note that in some languages (e.g. Hebrew and Arabic) there is no word for resembles or similar to. Hence one says *All thy garments are myrrh* instead of *are like myrrh*. It follows that an event can be compelled by imitating it. One engages in swarming not for pleasure but to produce a wind as the swarms does. Ball games are played to get rainy weather because the black ball represents dark rain clouds. Other ball games in which one attempts to catch the ball in a cup or hit it with a stick represent the sexual act (as some gentlemen at Lords may be distressed to hear) and bring about fertility. In medicine up till a few centuries ago herbs were chosen to cure a disease because in some respects their leaves or other parts looked like the part of the body affected (e.g. the common wildflower still known as eyebright was used in bathing the eyes because the flower looks like a tiny eye).

Uses of these beliefs are still found today in children's games and the spells accompanying them have turned into nursery rhymes. Dolls are the images of deposed gods or idols. Tug of war was formerly a sex conflict with men pulling one end and women the other to bring about fertility. Skittles when knocked down by a ball produced the thunder noise necessary to produce rain. There is reason to believe that the oldest words known in English relics of our prehistoric language are *Ene mena muna mo* of the nursery rhyme.

Divination is another aspect of magic and no general of the past would have gone to war with out consulting his diviners who referred to animals, livers, how the sacred chickens ate or the way ceremonially shot arrows fell. Even Cicero wrote a book on divination discussing the significance of dreams, premonitions and the flight of birds which revealed the purposes of the gods. If we find it difficult to make any distinction between diviners, priests, medicine men, rain makers, shamans and witch-doctors of early societies we could perhaps say that they have crystallised out into priests, scientists and humbugs of our own day. For it would appear that magic like witchcraft still exists today—not merely in the form of children's stories and fears or grown up enjoyment of creepy tales, belief in fortune telling omens and amulets—but as cults attracting many who ought to have more sense. See Witchcraft Demonism.

Malthusianism the theory about population growth put forward by the Rev Thomas Malthus (1766-1834) in *An Essay on Population* (1798). His three main propositions were: (1) Population is necessarily limited by means of subsistence. (2) Population invariably increases where means of subsistence increase unless prevented by some very powerful and obvious checks. (3) These checks and the checks which repress the superior power of population and keep its effects on a level with the means of subsistence are all resolvable into moral restraint, vice and misery. In other words no matter how great the food supply may

become human reproductive power will always adjust itself so that food will always be scarce in relation to population. The only means to deal with this is by moral restraint (i.e. chastity or not marrying) vice (i.e. birth control methods) or misery (i.e. starvation). More specifically Malthus claimed that while food increases by arithmetical progression population increases by geometrical progression.

It is true that these gloomy predictions did not take place in Malthus's time largely owing to the opening up of new areas of land outside Europe, the development of new techniques in agriculture, the growth of international trade to poorer areas, the increased knowledge of birth control and developments in medical science which reduced the misery he had predicted. Furthermore we now know that as a society becomes industrialised its birth rate tends to fall. Nevertheless there are very few scientists who are not perturbed by the growth in the world's population which has increased from about 485 million in 1650 to over 3 000 million today.

Manichaeism The early Christian apologists who had not yet acquired an adequate knowledge of philosophy had little intellectual trouble in dealing with the heathen trouble arose when confronted with religions which had a philosophical basis. Thus Gnosticism (q.v.) caused them a good deal of concern. Neoplatonism (see God and Man) rather less since it could never appeal to the masses and Manichaeism considerable anxiety because it could appeal both to the philosopher and the masses. Mithraism (q.v.) the only other serious contender was troublesome for a different reason in that it was the religion of the Roman army and bore a close resemblance to Christianity itself.

Manichaeism was an Asiatic religion which developed from Zoroastrianism (q.v.) and shows the influence of Buddhism (q.v.) and Gnosticism (q.v.) being founded by Mani a Persian who was born in Babylonia c. 216 A.D. Mani presented himself to Shapur I as the founder of a new religion which was to be Babylonia what Buddhism was to India or Christianity to the West. His aspiration was to convert the East and he himself made no attempt to interfere directly with Christianity although he represented himself as the Paraclete (the Holy Ghost or Comforter) and like Jesus had twelve disciples. His success in Persia aroused the fury of the Zoroastrian priests who objected to his reforming zeal towards their religion and in 276 Mani was taken prisoner and crucified.

Of Mani's complicated system little can be said here save that it is based on the struggle of two eternal conflicting principles: God and matter or light and darkness. Like the Albigenses (who followed much of this heresy) Mani divided the faithful into two classes: the

Perfect who were to practise the most rigid asceticism and the Hearers whose discipline was much less severe. After death the former went to heaven immediately the latter reached it only through a kind of purgatory and the unbelievers were doomed to hell. Although its founder had no intention of interfering with the West after his death his followers soon spread the religion from Persia and Mesopotamia to India and China (Manichaeism flourished in China until the 11th cent.) It reached as far as Spain and Gaul and influenced many of the bishops in Alexandria and in Carthage where for a time St. Augustine accepted Manichaeism. Soon the toleration accorded it under Constantine ended and it was treated as a heresy and violently suppressed. Yet it later influenced many heresies including as we have seen the Albigenses and it even had some influence on orthodox Catholicism which had a genius for picking up elements in other religions which had been shown to appeal to worshippers provided they did not conflict unduly with fundamental beliefs.

Maosism is the branch of communism that reigns in China. It has been shaped by one of the most remarkable statesmen of modern times Mao Tse tung who has set the pattern of revolution for poor peasant societies. The communist movement may be likened to a river

with three principal streams the left represented by China, the right represented by Yugoslavia and the middle represented by the Soviet Union. In Russia the civil war developed after the revolution in China the communists fought their civil war before they seized power. The Yugoslav partisans won their own guerrilla war against the fascist powers—difficulties which had important political consequences. Russia suffered three decades of isolationism and totalitarian suppression (in isolated and besieged fortress) before the death of Stalin. Then came a marked zigzagging shift towards liberalisation. Mao Tse tung holds to the orthodox Leninist view about capitalism and communism regards *détente* as a dangerous illusion and compromise and revisionism as a fatal error. The ideological dispute between these two great communist powers has developed since 1960 when Khrushchev ruthlessly withdrew economic and technical assistance and forced China into isolationism. It has been likened to the East-West schism in the Christian church. The solution is by no means predictable but having come through the hundred flowers campaign the great leap forward and the cultural revolution China in foreign affairs is now reaching against isolationism. See Section C Part I.

Maronites A Roman Catholic community of Christians living in the Mount Lebanon region. Their secular clergy marry as in the Greek Church but their bishops are celibate.

Marrism The sociological theories founded by Karl Marx and Friedrich Engels on which modern communist thought is based. Marx and Engels lived in a period of unrestrained capitalism when exploitation and misery were the lot of the industrial working classes and it was their humanitarianism and concern for social justice which inspired their work. They co-operated in 1848 in writing the *Communist Manifesto* and in his great work *Das Kapital* (1867) Marx worked out a new theory of society. He showed that all social systems are economically motivated and change as a result of technical and economic changes in methods of production. The driving force of social change Marx found to be in the struggle which the oppressed classes wage to secure a better future. Thus in his celebrated theory of historical materialism he interpreted history in terms of economics and explained the evolution of society in terms of class struggle (See Dialectical Materialism). In the social production of their means of existence he wrote 'men enter into definite and unavoidable relations which are independent of their will. These productive relationships correspond to the particular stage in the development of their material productive forces. Marx's theory of historical materialism implies that history is propelled by class struggle with communism and the classless society as the final stage when man will have emancipated himself from the productive process. Marx was the first to put socialism on a rational and scientific basis and he foretold that socialism would inevitably replace capitalism and that in the transition period the revolutionary dictatorship of the proletariat would be necessary. His prophecy however came to realisation not in the advanced countries as he had envisaged but in backward Russia and China. See also Communism.

Mensheviks See Bolshevism.

Mesmerism, a rapidly vanishing name to denote the practice of hypnosis which owes its popularity though not its discovery to the Frenchman Anton Mesmer (1733-1815). Mesmer's contribution was the realisation that a large number of what we would today call psychosomatic or hysterical conditions could be cured (or at least temporarily alleviated) by one or another form of suggestion. Mesmer himself relied on the idea of what he called animal magnetism, a supposedly potent therapeutic force emanating from the living body which could be controlled by the trained individual. Mesmer used wands and impressive gadgetry to dispense the marvellous force and he effected a remarkable number of cures of complaints

hitherto looked upon as incurable or totally mysterious in origin—the most typical of these being hysterical blindness, paralysis or deafness, nervous skin conditions and so on. Hypnosis which is a valid if very poorly understood psychological phenomenon even today would probably have been developed much further had not efficient general anaesthetics such as ether nitrous oxide etc. been discovered thus greatly diminishing its role as a pain reliever in surgery.

Mesmer who was three parts charlatan never really troubled to think deeply about the cause of his undoubted successes. The first man to treat hysteria as a formal class of illness and who made a scientific attempt to treat it with hypnosis was Ambrose Liébaux (1823-1904). He and his colleague Hippolyte Bernheim (1840-1919) believed (a) that hysteria was produced by suggestion and particularly by autosuggestion on the part of the patient and (b) that suggestion was a normal trait found in varying degrees in everyone. These conclusions are true but as Freud showed later are far from being the whole truth. See Paris School of Psychotherapy.

Methodism the religious movement founded by John Wesley in 1738 at a time when the Anglican Church was in one of its periodic phases of spiritual torpor with the simple aim of spreading scriptural holiness throughout the land. Up to that time Wesley had been a High Church man but on a visit to Georgia in the United States he was much impressed by the group known as Moravians (q.v.) and on his return to this country was introduced by his brother Charles who had already become an adherent to Peter Bohler a Moravian minister in England. Passing through a period of spiritual commotion following the meeting he first saw the light at a small service in Aldersgate in May 1738 where one was reading Luther's preface to the Epistle to the Romans and from this time forth all Wesley's energies were devoted to the single object of saving souls. He did this for fifty years and at the end of his life confessed that he had wasted fifteen minutes in that time by reading a worthless book. Even when he was over eighty he still rose at 4 a.m. and toiled all day long.

Soon Whitefield a follower with Calvinist views was preaching throughout the country and Charles Wesley was composing his well known hymns. John's abilities at this time were taken up in organising the movement described as

People called Methodists. They were to be arranged in societies which were united into circuits under a minister the circuits into districts and all knit together into a single body under a conference of ministers which has met annually since 1744. Local lay preachers were also employed and to maintain interest the ministers were moved from circuit to circuit each year. These chapel services were not originally meant to conflict with the Church of England of which Wesley still considered himself a member. They were purely supplementary and it used to be the custom (before the Methodists began to count themselves as Non-conformists) for Methodists to attend Church in the morning and Chapel in the evening.

The class meeting was the unit of the organisation where members met regularly under a chosen leader to tell their experiences upon which they were often subjected to severe cross examination. At the end of every quarter provided their attendances were regular they received a ticket of membership which entitled them to come to monthly sacramental services. If attendance was inadequate the name was removed from the list without appearance on which nobody was deemed a member. The price of the ticket was a penny a week and a shilling a quarter but Wesley was not interested in receiving money from anyone who was not utterly devoted to the cause.

John Wesley introduced four other innovations, some of which were regarded by Churchmen who had previously been willing to commend his efforts in bringing religion to the poorer classes as dangerous. (1) He started the Sunday school scheme and afterwards enthusiastically supported that of John Baileys, often

regarded as the founder of the idea, this was of immense importance in the days before the Education Acts. (2) He reintroduced the Agapae or love feasts of the early Church which were fellowship meetings deepening the sense of brotherhood of the society. (3) He began to copy the open air meetings of the eloquent Whitefield and soon unwittingly produced the most extraordinary results finding that his sermons led to groans, tears, fainting fits and all sorts of emotional expression. Even his open air lay speakers produced like results and these came to be associated with Methodism and gave significance to the proud Anglican claim that their services would be without enthusiasm. (4) After some hesitation he ventured to consecrate Dr Thomas Coke who was being sent as a missionary to America as a bishop of his church. In addition to Wesley's religious work he was a great educator of the common man. Thus he introduced the cheap book and the church magazine, publishing books of any sort which he thought would edify and not harm even when the views expressed were different from his own—e.g. Thomas à Kempis's *Imitation of Christ* and works of history, biography, science and medicine in some cases, written by himself. In this way the movement with its cheap books and reading rooms had an influence far beyond its actual membership. Both the Anglican Church and the Evangelical movement of Wilberforce and others profited from Wesley's work. Some social historians rightly or wrongly have claimed that it was Wesley's influence among the working classes that spared England the revolutionary activity which characterised most other European countries during the first quarter of the 19th cent.

Methodism, especially after Wesley's death in 1791, began like other movements to develop schisms. There were the long-standing differences which the Baptist movement (q.v.) had shown too between Arminian and Calvinist sections—i.e. between those who did and those who did not accept the doctrine of predestination. In the case of the Methodists, this led to a complete break in 1811. Then there were differences associated with the status of the laity or the relationship of the movement with the Anglican Church. The Methodist New Connexion of 1797 differed only in giving the laity equal representation with the ministers but the more important break of the Primitive Methodists in 1810 gave still more power to the laity and reintroduced the camp meeting type of service. In 1815 the Bryanites or Bible Christians were formed and a further schism which was even brought before the law courts was ostensibly over the foundation of a theological college. The real reason of course was that the ministers were becoming more Tory whilst the laity were becoming more Radical. Finally in 1832 at a conference in the Albert Hall in London, the Wesleyan Methodists, the Primitive Methodists and the United Methodists became one Church, the Methodist Church. Including America, where Methodism under the original direction of Thomas Coke spread like wildfire, the Methodist is one of the largest Protestant Churches of today.

Mind and Matter

Early Greek Views. Idealism and Dualism. Primitive peoples could see that there is a distinction between those things which move and do things by themselves and others, such as stones which do not. Following the early state of Animism (q.v.) in which spirits were believed to have their abode in everything they began to differentiate between matter or substance and a force which seems to move it and shape it into objects and things. Thus to the Greek Parmenides (fl. c. 475 B.C.) who was a philosopher of pure reason, thought or mind was the creator of what we observe and in some way not quite clear to himself it seemed that mind was the cause of everything. This is perhaps the first expression of the movement known as Idealism which says, in effect, that the whole universe is mental—a creation either of our own minds or the mind of God. But from Anaxagoras (484–428 B.C.) we have the clearer statement that mind or *nous* causes all movement but is distinct from the substance it moves.

He does not however think in terms of individual minds but rather of a kind of generalised mind throughout the universe which can be used as an explanation of anything which can not be explained otherwise. This is the position known as Dualism (q.v.) which holds that both mind and matter exist and interact but are separate entities.

Most people in practice are dualists since rightly or wrongly mind and body are thought of as two different things. It is the common sense (although not necessarily the true) point of view. Plato in a much more complex way was also a dualist although he held that the world of matter we observe is in some sense not the genuine world. The real world is the world of ideas and the tree we see is not real but simply matter upon which mind or soul has imprinted the idea of a tree. Everything that exists has its corresponding form in the world of ideas and imprints its pattern upon matter. Mind has always existed and having become entangled with matter is constantly seeking to free itself and return to God.

Plato's pupil Aristotle had a much more scientific outlook and held that although it was mind which gave matter its form, mind is not outside matter as Plato had thought but *in it* as its formative principle. Therefore there could be no mind without matter and no matter without mind for even the lowest forms of matter have some degree of mind which increases in quantity and quality as we move up the scale to more complex things.

So far nobody had explained how two such different substances as matter and mind could influence each other in any way and this remains, in spite of attempts to be mentioned later, a basic problem in philosophy.

Two later ideas, one of them rather foolish and the other simply refusing to answer the question, are typified by the Stoics and some members of the Sceptic school. The first is that only matter exists and what we call mind is merely matter of a finer texture, a view which as an explanation is unlikely to satisfy anyone the other that of some Sceptics is that we can know nothing except the fleeting images or thoughts that flicker through our consciousness. Of either mind or matter we know nothing.

Renaissance Attitude. Christian doctrines have already been dealt with (see God and Man, Determinism and Free-will) and the past and future of the soul is dealt with under Immortality. Nor need we mention the Renaissance philosophers who were really much more concerned about how to use mind than about its nature. When they did consider the subject they usually dealt with it as did Francis Bacon by separating the sphere of science from that of religion and giving the orthodox view of the latter because there were still good reasons for not wishing to annoy the Church.

17th-cent. Views. Hobbes, Descartes, Guelinckx, Spinoza, Locke, Berkeley, Thomas Hobbes in the 17th cent was really one of the first to attempt a modern explanation of mind and matter even if his attempt was crude. As a materialist he held that all that exists is matter and hence our thoughts, ideas, images and actions are really a form of motion taking place within the brain and nerves. This is the materialist theory which states that mind does not exist.

Thus there are three basic theories of the nature of mind and body: idealism, dualism and materialism and we may accept any one of the three. But if we accept dualism, we shall have to explain precisely the relationship between body and mind. In some of his later writings Hobbes seems to suggest that mental processes are the effects of motion rather than motion itself—i.e. they exist but only as a result of physical processes just as a flame does on a candle. This theory of the relationship is known as *epiphenomenalism*.

Descartes the great French contemporary of Hobbes, was a dualist who believed that mind and matter both exist and are entirely different entities, therefore he had to ask himself how for example, the desire to walk leads to the physical motion of walking. His unsatisfactory answer was that, although animals are pure

automatons, man is different in that he has a soul which resides in the pineal gland (a tiny structure in the brain which today we know to be a relic of evolution with no present function whatever). In this gland the mind comes in contact with the vital spirits of the body and thus there is interaction between the two. This theory is known as *interactionism* and since we do not accept its basis in the function of the pineal gland we are simply left with the notion of interaction but without the explanation of how it takes place.

One of Descartes' successors Arnold Guelinckx produced the even more improbable theory of *psychophysical parallelism* sometimes known as the theory of the two clocks. Imagine you have two clocks each keeping perfect time then supposing you saw one and heard the other every time one points to the hour the other will strike giving the impression that the first event causes the second although in fact they are quite unrelated. So it is with the body and mind in Guelinckx's view each is wound up by God in the beginning in such a way as to keep time with the other so that when I have the desire to walk purely unrelated physical events in my legs cause them to move at the same time. A variety of this theory is *occasionalism* which says that whenever some thing happens in the physical world God affects us so that we think we are being affected by the happening.

The trouble about all these theories is (a) that they really explain nothing and (b) that they give us a very peculiar view of God as a celestial showman treating us as puppets when it would surely have been easier to create a world in which mind and matter simply interacted by their very nature. Spinoza too believed in a sort of psychophysical parallelism in that he did not think that mind and body interacted. But since in his theory everything is God mind and matter are simply two sides of the same penny.

John Locke another contemporary thought of the mind as a blank slate upon which the world writes in the form of sensations for we have no innate or inborn ideas and mind and matter do interact although he does not tell us how. All we know are sensations—i.e. sense impressions. Bishop Berkeley carried this idea to its logical conclusion: if we know nothing but sensations we have no reason to suppose that matter exists at all. He was therefore an idealist.

18th cent. Views. *Hume* *Kant* *David Hume* went further still and pointed out that if all we know are sensations, we cannot prove the existence of matter but we cannot prove the existence of mind either. All we can ever know is that ideas impressions thoughts, follow each other. We do not even experience a self or personality because every time we look into our minds all we really experience are thoughts and impressions. Hume was quick to point out that this was not the same as saying that the self did not exist: it only proved that we cannot know that it does.

Kant made it clear that although there is a world outside ourselves, we can never know what it is really like. The mind receives impressions and forms them into patterns which conform not to the thing-in-itself but to the nature of mind. Space and time for example are not realities but only the form into which our mind fits its sensations. In other words our mind shapes impressions which are no more like the thing-in-itself than the map of a battlefield with pins showing the position of various army groups at any given moment is like the battlefield. This of course is true. From physics and physiology we know that the sounds we hear are really waves in the air the sights we see are really electromagnetic waves. What guarantee do we have that the source is really like the impression received in our brain? Kant was the leader of the great German Idealist movement of the 18th cent. which in effect said: why bother about matter when all we can ever know is mental?

19th and 20th cent. Views. The Englishman Bradley and the Frenchman Henri Bergson in the 19th and early 20th cent. both held

in one form or another the belief that mind in some way creates matter and were therefore idealists, whereas Comte and the positivist (q.v.) and the Americans William James and John Dewey held that mind is a form of behaviour. Certain acts (e.g. reflexes) are "mindless" because they are deliberate others which are intended may be described for the sake of convenience as minded (i.e. purposeful). But like the majority of modern psychologists—insofar as they take any interest in the subject—they regarded mind as a process going on in the living body. Is there any reason many now ask why we should think of mind as being any different in nature from digestion? Both are processes going on in the body the one in the brain the other in the stomach and intestines? Why should we regard them as things?

Mithraism a sun religion which originated in Persia with the worship of the mythical Mithra, the god of light and of truth. It was for two centuries one of early Christianity's most formidable rivals particularly in the West since the more philosophical Hellenic Christianity of the East had little to fear from it. (Arnold Toynbee has described Mithraism as a pre-Zoroastrian Iranian paganism—in a Hellenic dress. Manichaeism as Zoroastrianism—in a Christian dress.) Mithraism was a mystery faith with secret rites known only to devotees. It appealed to the soldiers of the Roman Army which explains its spread to the farthest limits of the Roman empire and its decline as the Romans retreated. The religion resembled Zoroastrianism (q.v.) in that it laid stress on the constant struggle between good and evil and there are a number of parallels with Christianity e.g. a miraculous birth death and a glorious resurrection a belief in heaven and hell and the immortality of the soul a last judgment. Both religions held Sunday as the holy day of the week, celebrated 25 December (date of the pagan winter solstice festival) as the birthday of the founder, both celebrated Easter and in their ceremonies made use of bell holy water and the candle. Mithraism reached its height about 275 A.D. and afterwards declined both for the reason given above and perhaps because it excluded women was emotional rather than philosophical, and had no general organisation to direct its course. Yet even today from the Euphrates to the Tyne, traces of the religion remain and antiquarians are familiar with the image of the sun-god and the inscription *Deo Soli Mithras Invicto Severus* (dedicated to the sun god of Mithra the unconquered). Mithraism enjoyed a brief revival of popular interest in the mid 1950s when workers excavating the foundations of the skyscraper Bucklersbury House in the City of London found the well preserved remains of a Roman Mithraic temple. Despite a campaign to save the temple as a national monument the skyscraper won and the London house of Mithras returned under ground once more.

Mohammedanism. See Islam.

Monasticism. When in the 4th cent. A.D. Constantine in effect united state and church there were naturally many who hastened to become Christians for the worldly benefits they expected it to bring in view of the new situation. But there were others who in their efforts to escape from worldly involvement went into the deserts of North Africa and Syria to live as hermits and so in these regions there grew up large communities of monks whose lives of renunciation made a considerable impression on the Christian world. They were men of all types but the two main groups were those who came to live alone and those who preferred a community life. Among the first must be included St. Anthony the earliest of the hermits who was born in Egypt c. 250 and who lived alone in a hut near his home for fifteen years and then in the desert for a further twenty. As his fame spread Anthony came forth to teach and advocate a life of extreme austerity until by the end of his life the Thebaid (the desert around Thebes) was full of hermits following his example. (Not un-naturally he was constantly assailed by lustful visions which he thoughtfully attributed to Satan.) In the Syrian desert St. Simeon

Stylites and others were stimulated to even greater austerities and Simeon himself spent many years on the top of a pillar in a space so small that it was only possible to sit or stand. With some of these men it is obvious that ascetic discipline had become perverted into an unpleasant form of exhibitionism.

The first monastery was founded by Pachomius of Egypt c 315 and here the monks had a common life with communal meals, worship and work mainly of an agricultural type. In the Eastern part of the Empire St Basil (c 360) tried to check the growth of the extreme and spectacular practices of the hermits by organising monasteries in which the ascetic disciplines of fasting, meditation and prayer would be balanced by useful and healthy activities. His monasteries had orphanages and schools for boys—not only those who were intended for a monkish life. But the Eastern Church in general continued to favour the hermit life and ascetic extremes. Originally a spontaneous movement the monastic life was introduced to the West by St Athanasius in 339 who obtained its recognition from the Church of Rome and St Augustine introduced it into North Africa beyond Egypt. The movement was promoted also by St Jerome, St Martin of Tours who introduced it into France and St Patrick into Ireland. The monastery of Iona was founded by St Columba in 560. But it must be remembered that the Celtic Church had a life of its own which owed more to the Egyptian tradition than to Rome. Unlike the more elaborate monasteries of the continent those of the early Celtic Church were often little more than a cluster of stone huts, an oratory and a stone cross. It had its own religious ceremonies and its own art (notably its beautifully carved crosses and the illuminated manuscripts such as the Lindisfarne Gospel (c 700) and the Irish Book of Kells dating from about the same time). The Scottish St Ninian played a major part in introducing Egyptian texts and art to Britain where mixed with Byzantine influences and the art of the Vikings it produced a typical culture of its own. Strangely enough it was the relatively primitive Celts who played almost as large a part in preserving civilisation in Europe during the Dark Ages as did the Italians since it was St Columbanus (c 540–615) who founded the great monasteries of Annegray, Luxeuil and Fontaine in the Vosges country, St Gall in Switzerland and Bobbio in the Apennines. So too it was the Anglo-Saxon Alcuin (c 735–804) who was called from York by Charlemagne to set up a system of education throughout his empire—the most famous of the monastic schools he founded was at Tours. Among these influenced by him was the philosopher John Scotus Erigena.

Meanwhile from the south as the disintegrating Roman empire became increasingly corrupt St Benedict of Nursia (c 480–c 543) fled the pleasures of Rome to lead a hermit's life near Subiaco. Here he founded some small monasteries but c 520 made a new settlement, the great monastery of Monte Cassino in southern Italy where he established a Rule for the government of monks. This included both study and work and emphasised that education was necessary for the continuance of Christianity. As his influence spread his Rule was adopted by other monasteries and schools became part of monastic life. It is not possible to describe the many different orders of monks and nuns formed since not the monastic orders of monks (e.g. Franciscans, Dominicans, Carmelites, Augustinians). In many ways even those outside the Roman Catholic Church owe much to the monastic movement. Monasticism of course is not peculiar to Christianity and forms a major aspect of Buddhism especially in the form of Lamaism in Tibet (q.v.).

Monophysitism a heresy of the 5th cent which grew out of a reaction against Nestorianism (q.v.). The majority of Egyptian Christians were Monophysites. (Monophysite = one nature) — i.e. they declared Christ a human and divine nature to be one and the same. This view was condemned at the Council of Chalcedon (A.D. 451) which pronounced that Jesus Christ true God and true man has two natures at once

perfectly distinct and inseparably joined in one person and partaking of the one divine substance. However many continued to hold Monophysite opinions including the Coptic Church (q.v.) declaring the Council to be un-ecumenical (i.e. not holding the views of the true and universal Christian Church).

Monopsychism the theory of the intellect held by the Arab philosopher Averroës (1126–98) in his interpretation of Aristotle maintaining that the individual intelligence has no existence in its own right but is part of the divine mind (*nous*) from which it emerges at birth and into which it is absorbed at death. He thus denied personal immortality a view which was opposed by Christian philosophers.

Monothelites a Christian sect of the 7th cent which attempted to reconcile Monophysitism with orthodoxy. They admitted the orthodox view of Christ's two natures as God and man but declared that He operated with one will. Monothelitism was condemned as heretical by the Council of Constantinople in 680 A.D.

Montanism a Pagan form of primitive Puritanism with many peculiar tenets into which the early Christian theologian Tertullian (c 160–c 230) was driven by his extremist views that the Christian should keep himself aloof from the world and hold no social intercourse whatever with pagans. The sect had immediate expectation of Christ's second coming and indulged in prophetic utterance which they held to be inspired by the Holy Ghost but which their enemies put down to promptings by the Devil. In seeking persecution and martyrdom they antagonised the Church and were suppressed.

Moral Re Armament, a campaign launched in 1938 by an American evangelist of Lutheran background Frank N. D. Buchman (1878–1961) founder of the Oxford Group Movement and at first associated with the First Century Church Fellowship, a fundamentalist Protestant revivalist movement. On a visit to England in 1920 Buchman preached world changing through life changing to undergraduates at Oxford hence the name Oxford Group. This revivalist movement was based on Buchman's conviction that world civilisation was breaking down and a change had to be effected in the minds of men.

Two of the Group's most typical practices were group confession of sins openly and the quiet time set aside during the day to receive messages from the Almighty as to be haviour and current problems. In the eyes of non-Croupers the confession (often of trivial sins) appeared to be exhibitionist and there was felt to be a certain snobbery about the movement which made it strongly conscious of the social status of its converts.

The Oxford Group gave way to Moral Re Armament the third phase of Buchmanism. M.R.A. men and women lay stress on the four moral absolutes of honesty, purity, love and unselfishness. They believe they have the ideas to set the pattern for the changing world and indeed claim to have aided in solving many international disputes—political, industrial and racial. Theologians complained of the Groups that their movement lacked doctrine and intellectual content. M.R.A. is no different in this respect.

Moravian Church a revival of the Church of the Bohemian Brethren which originated (1457) among some of the followers of John Hus. It developed a kind of Quakerism that rejected the use of force, refused to take oaths and had no hierarchy. It appears to have been sympathetic towards Calvinism but made unsuccessful approaches to Luther. As a Protestant sect it was ruthlessly persecuted by Ferdinand II and barely managed to survive. However in the 18th cent the body was re-established by Count Zinzendorf who offered it a place of safety in Saxony where a town called Herrnhut (God's protection) was built and this became the centre from which Moravian doctrine was spread by missionaries all over the world. Their chief belief (which had a fundamental influence on John Wesley—see Methodism) was that faith is a direct illumination from God which assures us beyond all possibility of doubt that we are saved and that no goodness of behaviour, piety

or orthodoxy is of any use without this sufficient sovereign saving grace.

Mormons, or Latter day Saints one of the very numerous American religious sects founded in 1830 by Joseph Smith the son of a Vermont farmer who as a youth had been influenced by a local religious revival though confused by the conflicting beliefs of the various denominations. He said that while praying for guidance he had been confronted by two heavenly messengers who forbade him to join any existing church but prepare to become the prophet of a new one. Soon in a series of visions he was told of a revelation written on golden plates concealed in a nearby hillside. These he unearthed in 1827 and with the help of Urin and Thumman translated the reformed Egyptian characters into English. Described as the *Book of Mormon* this was published in 1830 and at the same time a little church of those few who accepted his testimony was founded in Fayette N.Y. In addition the first of Joseph Smith's miracles—the casting out of a devil—was performed. The *Book of Mormon* purports to be a record of early American history and religion the American Indians being identified as the ten Lost Tribes of Israel whose fate has never failed to attract the attention of those who prefer myth to fact (cf. British Israelites). Jesus Christ is alleged to have appeared in America after His ascension. Yet Smith's influence was able to influence quite educated people including Sidney Rigdon with whom he went into business for a time. *Doctrine and Covenants* is the title of another book dealing with the revelations Smith claimed to have received. Soon the sect was in trouble with the community both because its members insisted on describing themselves as the Chosen People and others as Gentiles and because they took part in politics voting as Smith ordered them to. Smith was constantly in trouble with the police. Therefore they were turned out from one city after another until they found themselves a dwelling place at Nauvoo Illinois on the Mississippi.

That would probably have been the end of the story had not Smith been murdered in 1844 and thereby made to appear a martyr and had there not appeared Brigham Young a quite extraordinary leader who stamped out warring factions and drove out the recalcitrant. While persecutions continued Brigham Young announced that it had been revealed that he must lead the faithful to Salt Lake then outside the area of the United States. There followed the famous trek of more than a thousand miles across desert country in which he led the way reaching his journey's end in the forbidding valley of the Great Salt Lake on 24 July 1847. By 1851 30 000 Mormons had reached the Promised Land. Here they held their own in a hostile environment and under the practical genius of their leader carried through a vast irrigation scheme and built Salt Lake City which still serves as the headquarters of their sect. In 1850 their pioneer settlement was made Utah Territory and in 1896 incorporated in the Union. The church was strictly ruled by its leader who also looked after affairs of state for thirty years until his death in 1877.

Polygamy although opposed by some Mormons and only sanctioned by Brigham Young when Salt Lake City had been built, is the best known of Mormon doctrines. It brought the sect into much disrepute and was renounced in 1890. Mormons are millenarians believing that some time Christ will appear and rule for a thousand years.

There are two orders of priests or leaders the Melchizedeks or higher order include the apostles or ruling elders and the high priest the Aaronic priesthood or lower order attends to the temporal affairs of the church as the Melchizedeks attend to the spiritual. Members abstain from alcohol tobacco coffee and tea. The church lays stress on the importance of revelation through visions, on education to meet the social, spiritual and cultural needs of its members, and on community welfare. Members of the Church of Jesus Christ of Latter-day Saints now number over two million in congregations throughout the world.

The Reorganised Church of Jesus Christ of Latter day Saints with its headquarters at Independence Missouri has been separate and distinct since 1852.

Muggletonians one of the many sects which arose during the Commonwealth but unlike most of the others (Levellers (qv) Diggers (qv) Fifth Monarchy Men and the Millenarians) which tended to have a strongly political aspect this was purely religious. Founded by two journey-men tailors Lodowick Muggleton and John Reeve who interpreted the Book of Revelation in their own peculiar way it was decided that Reeve represented Moses and Muggleton Aaron. They also believed that the Father not the Son had died on the cross (an ancient heresy) but added the strange statement that He left Elijah in control during His period on earth. Rejecting the doctrine of the Trinity they also asserted that God has a human body. Nevertheless for a time they had a large number of followers.

Mysticism, a religious attitude which concerns itself with direct relationship with God reality as contrasted with appearance or the ultimate in one form or another. All the higher religions have had their mystics who have not always been regarded without suspicion by their more orthodox members and as Bertrand Russell points out there has been a remarkable unity of opinion among mystics which almost transcends their religious differences. Thus characteristic of the mystical experience in general have been the following features: (1) a belief in insight as opposed to analytical knowledge which is accompanied in the actual experience by the sense of a mystery unveiled, a hidden wisdom become certain beyond the possibility of doubt this is often preceded by a period of utter hopelessness and isolation described as the dark night of the soul. (2) a belief in unity and a refusal to admit opposition or division anywhere. This sometimes appears in the form of what seem to be contradictory statements the way up and the way down is one and the same (Heraclitus). There is no distinction between subject and object the act of perception and the thing perceived. (3) a denial of the reality of time since if all is one the distinction of past and future must be illusory. (4) a denial of the reality of evil (which does not maintain e.g., that cruelty is good but that it does not exist in the world of reality as opposed to the world of phantoms from which we are liberated by the insight of the vision). Among the great mystics have been Meister Eckhart and Jakob Boehme the German religious mystics of the 13th and 16th cent. respectively Acharya Sankara of India and St. Theresa and St. John of the Cross of Spain. Mystical movements within the great religions have been the Zen (qv) movement within Buddhism Taoism in China the Cabalists and Hasidim in Judaism the Sufis within Islam some of the Quakers within Christianity. **Mystery Religions.** See Orphism.

N

Natural Law the specifically Roman Catholic doctrine that there is a natural moral law in respect of time and place, which man can know through his own reason. Originally a product of early rational philosophy the Christian form of the doctrine is basically due to St. Thomas Aquinas who defined natural law in relation to eternal law holding that the eternal law is God's reason which governs the relations of all things in the universe to each other. The natural law is that part of the eternal law which relates to man's behaviour. Catholic natural law assumes that the human reason is capable of deriving ultimate rules for right behaviour since there are in man and his institutions certain stable structures produced by God's reason which man's reason can know to be correct and true. Thus, the basis of marriage, property the state and the contents of justice are held to be available to man's natural reason. The rules of positive morality

and civil law are held to be valid only insofar as they conform to the natural law which man is not only capable of knowing but also of obeying.

Protestant theologians criticize this notion. Thus Karl Barth and many others hold that sinful and fallen man cannot have any direct knowledge of God or His reason or will without the aid of revelation. Another theologian, Niebuhr, points out that the principles of the doctrines are too inflexible and that although they are the product of a particular time and circumstance they are regarded as if they were absolute and eternal. In fact, as most social scientists would also agree, there is no law which can be regarded as natural for all men at all times. Nor does it seem sensible to suppose that all or even many men possess either the reason to discern natural law or the ability to obey it, whether or not we accept man's free will (and all Protestant sects do not). We know as a fact of science that people are not always fully responsible for their actions and some not at all.

Nazism, the term commonly used for the political and social ideology of the German National Socialist Party inspired and led by Hitler. The term *Nazi* was an abbreviation of National Socialist. Those in the Federal Republic today sympathetic to National Socialism are known as neo Nazis. See Fascism.

Neoplatonism. See Determinism and Free will and God and Man.

Nestorian heresy. The 5th cent. of the Christian Church saw a battle of personalities and opinions waged with fanatical fury between St. Cyril the patriarch of Alexandria and Nestorius patriarch of Constantinople. Nestorius maintained that Mary should not be called the mother of God as she was only the mother of the human and not of the divine nature of Jesus. This view was contradicted by Cyril (one of the most unpleasant saints who ever lived) who held the orthodox view. In addition to his utter destruction of Nestorius by stealthy and unrelenting animosity Cyril was also responsible for the lynching of Hypatia, a distinguished mathematician and saintly woman head of the Neoplatonist school at Alexandria. She was dragged from her chariot, stripped, naked, butchered and torn to pieces in the church and her remains burned. As if this were not enough Cyril took pains to stir up pogroms against the very large Jewish colony of Alexandria. At the Council of Ephesus (A.D. 431) the Western bishops quickly decided for Cyril. This Council (reinforced by the Council of Chalcedon in 451) clarified orthodox Catholic doctrine (see Monophysitism). Nestorius became a heretic, was banished to Antioch where he had a short respite of peace but later and in spite of his weakness and age was dragged about from one place to another on the borders of Egypt. We are assured that his tongue was eaten by worms in punishment for the wicked words he had spoken, but later the Nestorian church flourished in Syria and Persia under the protection of the rulers of Persia and missions were sent to India and China.

Nihilism, the name commonly given to the earliest Russian form of revolutionary anarchism. It originated in the early years of Tsar Alexander II (1818-81), the liberator of the serfs who during his attempts to bring about a constitutional monarchy was killed by a bomb. The term nihilist, however, was first used in 1862 by Turgenyev in his novel *Fathers and Children*. See Anarchism.

Nominalism. Early mediaeval thinkers were divided into two schools: those who regarded universals or abstract concepts as mere names without any corresponding realities (Nominalists) and those who held the opposite doctrine (Realists) that general concepts have an existence independent of individual things. The relation between universals and particulars was a subject of philosophical dispute all through the Middle Ages.

The first person to hold the nominalist doctrine was probably Roscelin or Roscelinus in the late 11th cent. but very little is known of him and none of his works remains except for a single letter to Peter Abelard who was his pupil.

Roscelin was born in France, recused twice of heresy but recanted and fled to England where he attacked the views of Anselm, according to whom Roscelin used the phrase that universals were a *fatus vov* or breath of the voice. The most important nominalist was the Englishman William of Occam in the 13th cent. who once and for all separated the two schools by saying in effect that science is about things (the nominalist view) whereas logic, philosophy and religion are about terms or concepts (the Platonic tradition). Both are justified but we must distinguish between them. The proposition man is a species is not a proposition of logic or philosophy but a scientific statement since we cannot say whether it is true or false without knowing about man. If we fail to realize that words are conventional signs and that it is important to decide whether or not they have a meaning and refer to something then we shall fall into logical fallacies of the type Man is a species. Socrates is a man therefore Socrates is a species. This in effect is the beginning of the modern philosophy of logical analysis which to oversimplify tells us that a statement is not just true or untrue, it may also be meaningless. Therefore in all the philosophical problems we have discussed elsewhere there is the third possibility that the problem we are discussing has no meaning because the words refer to nothing, and we must ask ourselves before going any further what do we mean by God, has the word free will any definite meaning?

Nonconformism, the attitude of all those Christian bodies which do not conform to the doctrines of the Church of England. Up to the passing of the Act of Uniformity in 1562 they were called puritans or dissenters and were often persecuted. The oldest bodies of nonconformists are the Baptists, Independents and (in England) the Presbyterians, the Methodists (although dating from 1728) did not consider themselves nonconformists until some time later. The Presbyterians are of course the official Church of Scotland where it is the Anglicans (known as Episcopalians) who are the nonconformists although not generally described as such.

0

Objectivism, a semi-political philosophy expounded by the American novelist Ayn Rand and interesting in as much as it was first propagated through two of her own best-selling novels. The thesis of Objectivism is the inherent suitability of the competitive capitalist system for the well-being and advancement of the human race. The seeds of man's destruction, Miss Rand believes, are to be found in the creeping menace of socialism which by its tendency to encourage the individual to rely on the state rather than himself undermines the dynamic power of human hard work and self-interest. In her first and perhaps most significant novel *The Fountainhead* she tells the story of an unconventional and highly self-motivated architect, Howard Roark, who achieves world fame and success by a combination of hard work, talent and refusal to compromise. Her second, major novel *Atlas Shrugged* which is over 1100 pages long pictures a world in which the objectivists (the hard working self-motivated highly talented individuals in the human race) decide to pull out from society and set up a secret nation of their own. Left to its own devices the world of socialist slackers and loafers slides into grey destruction. Objectivism seems to have arisen as a kind of counterblast to the growing tendency within some sections of the United States to decry capitalism as impersonal profiteering and followers sport as their insignia a small badge depicting the dollar sign—the emblem incidentally of the secret states in *Atlas Shrugged*. The movement which relies heavily on the talent and personality of its founder has made little headway into formal American politics but Miss Rand's books which have sold literally by the

millions obviously touch a chord in many readers' minds. The philosophical maxim by which Occam's Razor or Occam's 13th cent nominalist (c. 1250) has become best known. This states in the form which is most familiar. Entities are not to be multiplied without necessity and as such does not appear in his works. He did however say something much to the same effect. It is vain to do with more what can be done with fewer. In other words it is very thin, in some science can be interpreted without assuming this or that hypothetical entity there is no ground for assuming it. This is Bertrand Russell's version and he adds. I have myself found this a most fruitful principle in logical analysis.

Occultism. See Magic Alchemy Astrology and Theosophy

Orangemen members of an Irish society formed in Ulster in 1795 to uphold Protestantism. Their name is taken from King William III Prince of Orange who defeated James II at the Battle of the Boyne (1690) hence the enormous banners depicting King Billy on the Boyne carried in procession on 12 July each year. Since 1921 the ruling political party of N. Ireland (the Unionist Party) has been largely maintained by the Orange Order. The Order has branches in many British Indian countries but flourishes chiefly in Ulster.

Orgonomy a pseudo psychological theory advanced by the German psychiatrist Wilhelm Reich (1897-1957) a pupil of Freud who was expelled from Germany for attacking the Nazis and who started his fresh in the U.S.A. like so many of his colleagues. Moving quickly away from orthodox psychoanalytic theories Reich became increasingly obsessed with the view that all living things were permeated with a unique force or energy which he termed "orgone" and which he believed could be photographed and measured with a Geiger counter. The key to the successful flow of orgone through out the body was sexual intercourse and the resulting orgasm (hence orgone). Reich achieved a substantial following for his increasingly bizarre views and when he was sentenced to two years imprisonment in 1956 for alleged medical malpractice & civil rights controversy developed which has not died down to this date. There is a current strong revival of interest in Reich orgonomy and some of his parallel ideas particularly among the hippy and underground movements. He is unfortunately a rather tragic death in prison has fanned the emotional issues and granted him the important role of martyr to his cause.

Origenists a sect of early religionists led by the Christian Father Origen in the 3rd cent. who accepted in general the doctrines of Plotinus (see Neoplatonism). They believed that men's souls are created before their bodies and are striving to enter bodies as they are born. When the soul leaves the body it enters another body if it has been sinful since justice requires punishment but the punishment happens naturally through the driving power of the sinner's own errors. The celestial bodies are believed also to have souls, and it is asserted that Christ was the Son of God only by adoption and grace. The Council of Constantinople in 553 condemned Origen's doctrines.

Orphism. The Greeks in general thought very little of their gods regarding them as similar to human beings with human failings and virtues although on a larger scale. But there was another aspect of Greek religion which was passionate ecstatic and secret dealing with the worship of various figures among whom were Bacchus or Dionysus Orpheus and Demeter and Persephone of the Eleusinian Mysteries. Dionysus (or Bacchus) was originally a god from Thrace where the people were primitive farmers naturally interested in fertility cults. Dionysus was the god of fertility who only later came to be associated with wine and the divine madness it produces. He assumed the form of a man or a bull and his worship by the time it arrived in Greece became associated with women (as was the case in most of the Mystery Religions) who spent nights on the hills dancing and possibly drinking wine in order to stimulate ecstasy an

unpleasant aspect of the cult was the tearing to pieces of wild animals whose flesh was eaten raw. Although the cult was disapproved of by the orthodox and needless to say by husbands it existed for a long time. This primitive and savage religion in time was modified by that attributed to Orpheus whose cult was more spiritualised ascetic and substituted mental or physical invocation. Orpheus may have been a real person or a legendary hero and he too is supposed to have come from Thrace but his name indicates that he or the movement associated with him came from Crete and originally from Egypt which seems to have been the source of many of its doctrines. Crete it must be remembered was the island through which Egypt influenced Greece in other respects. Orpheus is said to have been a reformer who was torn to pieces by the Maenad worshippers of Dionysus. The Orphics believed in the transmigration of souls and that the soul after death might obtain either eternal bliss or temporary or permanent torment according to its way of life upon earth. They held ceremonies of purification and the more orthodox abstained from animal food except on special occasions when it was eaten ritually. Man is partly earthly partly heavenly and a good life in creases the heavenly part so that the soul may become one with Bacchus and be called a Bacchant.

Bacchus. The religion had an elaborate theology (see Section H 117-138). As the Bacchic rites were reformed by Orpheus so the Orphic rites were reformed by Pythagoras (c. 582-c. 507 B.C.) who introduced the mystical element into Greek philosophy which reached its heights in Plato. Other elements entered Greek life from Orphism. One of these was feminism which was notably lacking in Greek civilisation outside the Mystery Religions. The other was the drama which arose from the rites of Dionysus. The mysteries of Eleusis formed the most sacred part of the Athenian state religion and it is clear that they had to do with fertility rites also for they were in honour of Demeter and Persephone and all the myths speak of them as being associated with the supply of corn to the country (see Section H 110-116). Without being provocative it is accepted by most anthropologists and many theologians that Christianity just as it accepted elements from Gnosticism and Mithraism accepted elements from the Mystery Religions as they in turn must have done from earlier cults. The miraculous birth the death and resurrection the sacramental feast of bread and wine symbolising the eating of the flesh and drinking of the blood of the god all these are common elements in early religions and not just in one. None of this means that what we are told about Jesus is not true, but it surely does mean (a) that Christianity was not a sudden development (b) that the early Church absorbed many of the elements of other religions (c) that perhaps Jesus Himself made use of certain symbols which He knew had a timeless significance for man and invested them with new meanings.

Orthodox Eastern Church. There are two groups of Eastern churches (1) those forming the Orthodox Church dealt with here which include the ancient Byzantine patriarchates of Constantinople Alexandria Antioch and Jerusalem and the national churches of Russia Greece Yugoslavia Bulgaria Rumania etc (although Orthodox communities exist all over the world and are no longer confined to geographical areas) (2) the churches which rejected Byzantine orthodoxy during various controversies from the 5th to the 7th cent. notably the Coptic church (q.v.) and the Armenian church. Although all Orthodox churches share the same doctrine and traditions they are arranged as national independent bodies each with its own hierarchy. They do not recognise the pope and the primacy of the patriarch of Constantinople is largely an honorary one. Although claiming to be the One Holy Catholic and Apostolic Church its alleged infallibility rests on universal agreement rather than on any one individual, and agreement over the faith comes from the Scriptures interpreted in the light of the Tradition. The latter includes dogmas relating to the Trinity

Christology Mariology and Holy Icons the testimony of the Fathers (St. Athanasius St. Basil St. John Chrysostom St. Cyril of Alexandria etc.) the canons or rules as formulated by the Councils and the Fathers. The Orthodox Church did not take part in the great Western controversies about the Bible nor of course in the Reformation. Attempts have recently been made to improve relations between Rome and Constantinople the two Churches agreed in 1965 to retract the excommunications cast on each other in A.D. 1054 which formalised the Great Schism.

Oxford Group *See* Moral Re-Armament
Oxford Movement *See* Tractarianism

P

Pantheism *See* God and Man.

Papal Infallibility The basis of papal infallibility is (a) that every question of morals and faith is not dealt with in the Bible so it is necessary that there should be a sure court of appeal in case of doubt and this was provided by Christ when he established the Church as His Teaching Authority upon earth. (b) ultimately this idea of the teaching function of the Church shapes the idea of papal infallibility which asserts that the pope when speaking officially on matters of faith or morals is protected by God against the possibility of error. The doctrine was proclaimed in July 1870.

Infallibility is a strictly limited gift which does not mean that the pope has extraordinary intelligence that God helps him to find the answer to every conceivable question or that Catholics have to accept the pope's views on politics. He can make mistakes or fall into sin his scientific or historical opinions may be quite wrong he may write books that are full of errors. Only in two limited spheres is he infallible and in these only when he speaks officially as the supreme teacher and lawgiver of the Church defining a doctrine that must be accepted by all its members. When after studying a problem of faith or morals as carefully as possible and with all available help from expert consultants he emerges with the Church's answer—on these occasions it is not strictly an answer it is the answer.

Historically speaking the Roman Catholic Church of the early 19th cent. was at its lowest ebb of power. Pope Pius IX in fear of Italian nationalism, revealed his reactionary attitude by the feverish declaration of new dogmas the canonisation of new saints the denunciation of all modern ideals in the Syllabus of Errors and the unqualified defence of his temporal power against the threat of Garibaldi. It is not too much to say that everything regarded as important by freedom loving and democratic people was opposed by the papacy at that time. In 1870 after a long and sordid struggle the Vatican Council convened by Pius IX, pronounced the definition of his infallibility. Dollinger a German priest and famous historian of the Church was excommunicated because like many others he refused to accept the new dogma. It is difficult not to doubt that there was some connection between the pronouncement of the pope's infallibility and his simultaneous loss of temporal power.

After the humanism of the Second Vatican Council (1962-5) the Pope's encyclical *Humanae Vitae* (1968) condemning birth control came as a great disappointment to the many people (including theologians, priests, and laymen) who had expected there would be a change in the Church's teaching. The Church's moral guidance on this controversial issue however does not involve the doctrine of infallibility. (The Roman Catholic Church teaches that papal pronouncements are infallible only when they are specifically defined as such.)

Paris School of Psychotherapy The Paris school is important because it was the school of the famous French neurologist Jean Charcot (1825-95), teacher of Sigmund Freud (1856-1939) and Pierre Janet (1859-1947). At a time when hypnosis and the neurosis known as hysteria

were very much in the air and Laëbeault and his colleagues (*see* Mesmerism) were regarding hysteria as a condition which was produced by autosuggestion Charcot was maintaining the opposite view. Hypnosis or the ability to be hypnotised was in his view a symptom of a hysterical personality and hysteria had a physiological basis.

Charcot was a highly controversial figure and his demonstrations were famous if to some verging on the notorious. He aroused much antagonism among Roman Catholics by stating that faith cures at Lourdes were actually cases of hysteria and not therefore miraculous since they could equally well be cured by himself. His supposed words 'You will always find sex at the root of the trouble' and his pupil Janet's evidence that forgotten (or as we should now say repressed) traumatic events lay behind the symptoms which would go when the event was allowed expression had a potent influence on the young Freud who made the uncovering of the past and the importance of sex the foundations of psychoanalysis. Modern belief is that Charcot was wrong about the physical basis of hysteria, wrong about the pathological significance of hypnosis but right on the whole about the importance of sexual problems in neurosis.

Parapsychology the name given to the study of psychical research (*qv*) as an academic discipline and chosen to denote the topic supposed status as a branch of psychology. The impetus behind parapsychology came from the psychologist William McDougall who persuaded Duke University in North Carolina U.S.A. to found a department of parapsychology under J. B. Rhine. Throughout the 1930s and 40s the work of Rhine and his colleagues who claimed to have produced scientific evidence for the existence of ESP attracted world wide attention. Increasing reservations about the interpretation of Rhine's results and an apparent lack of any readily repeatable experiments however gradually eroded scientific confidence in the topic. Today there is a growing feeling in academic circles that parapsychology has failed to make its case and no longer merits much support as an independent scientific discipline. Rhine retired from university life in 1965 and the world famous parapsychology laboratory at Duke was closed.

Parsees *See* Zoroastrianism.

Paulicians a Christian heretical sect which derives its name not from Paul the Apostle but from Paul of Samosata who was patriarch of Antioch, 260-72. His followers, the Pauliani, were condemned for their Adoptionist (*qv*) attitude by the Council of Nicaea (325). Originally wide spread in Anatolia, especially in Armenia from the 5th cent. onwards they were cruelly persecuted by the Byzantine emperors and were deported (c. 755) to the Balkans to garrison that part of the East Roman empire. Elsewhere in this section the Albigenses or Cathari are mentioned the Paulicians form part of their spiritual ancestry. It is debatable whether the Adoptionist doctrines professed by the Albigenses came from the Balkan Bogomils through the Crusaders, or from the north of Spain where there was an Adoptionist movement in the late part of the 8th cent. The evidence seems to be in favour of the Balkan influence but it should be noted that although the Bogomils were influenced by the Paulicians and the Manicheans the Paulicians themselves repudiated Manicheism. An authentic liturgical book of the Paulicians—*The Key of Truth*—was discovered in 1891 in Echmiadzin where the Armenian historical archives were kept. This manuscript throws new light on the heresy Pavlovian theory. *See* Behaviourism.

Phrenology a psychological school founded in 1800 by two Germans Franz Josef Gall and Johann Gaspar Spurzheim. Gall was an anatomist who believed there to be some correspondence between mental faculties and the shape of the head. He tested these ideas in prisons and mental hospitals and began to lecture on his findings arousing a great deal of interest throughout both Europe and America where his doctrines were widely accepted. Phrenology became fashionable, and people

would go to have their bumps read as later men and women of fashion have gone to be psychoanalysed. Roughly speaking Gall divided the mind into thirty seven faculties such as destructiveness, suavity, self-esteem, conscientiousness, and so on, and claimed that each of these was located in a definite area of the brain. He further claimed that the areas in the brain corresponded to bumps on the skull which could be read by the expert thus giving a complete account of the character of the subject. In fact (a) no such faculties are located in the brain anywhere for this is simply not the way the brain works (b) the faculties described by Gall are not pure traits which cannot be further analysed and are based on a long outdated psychology (c) the shape of the brain bears no specific relationship to the shape of the skull. Phrenology is a pseudo science, there is no truth in it whatever. But even so like astrology it still has its practitioners.

Physiocrats. A French school of economic thought during the 18th cent. known at the time as *Les Economistes* but in later years named physiocrats by Du Pont de Nemours, a member of the School. Other members were Quesnay, Mirabeau and the great financier Turgot. The physiocrats held the view common to the 18th cent. and deriving ultimately from Rousseau of the goodness and bounty of nature and the goodness of man as he came from the bosom of nature. The aim of governments therefore should be to conform to nature and so long as men do not interfere with each other's liberty and do not combine among themselves governments should leave them free to find their own salvation. Criminals, madmen and monopolists should be eliminated. Otherwise the duty of government is *laissez faire laissez passer*. From this follows the doctrine of free trade between nations on grounds of both justice and economy for the greater the competition the more will each one strive to economise the cost of his labour to the general advantage. Adam Smith although not sharing their confidence in human nature learned much from the physiocrats eliminated their errors and greatly developed their teaching.

Physiognomy. See Characterology.

Pietism, a movement in the Lutheran Church at the end of the 17th cent.—the reaction after the sufferings of the thirty years war of a pious and humiliated people against learning, pomp and ceremony and stressing the importance of man's personal relationship with God. The writings of Johann Georg Hamann (1730-88) who came from a Pietist family of Königsberg influenced Kierkegaard. The Pietist movement was the root of the great Romantic movement of the 18th cent.

Plymouth Brethren, a religious sect founded by John Nelson Darby a minister of the Protestant Church of Ireland and Edward Cronin a former Roman Catholic in 1827. Both were dissatisfied with the lack of spirituality in their own and other churches and joined together in small meetings in Dublin every Sunday for "the breaking of bread." Soon the movement began to spread through Darby's travels and writings and he finally settled in Plymouth, giving the popular name to the Brethren. Beginning as a movement open to all who felt the need to keep the unity of the Spirit, it soon exercised the right to exclude all who had unorthodox views and split up into smaller groups. Among these the main ones were the

Exclusives, the Kellyites, the Newtonites and Bethsads whose main differences were over problems of church government or prophetic powers. Some of these are further split among themselves. Readers of *Father and Son* by Sir Edmund Gosse, which describes life with his father the eminent naturalist Philip Gosse who belonged to the Brethren, will recall how this basically kind, honest and learned man was led through their teachings to acts of unkindness (e.g. in refusing to allow his son and other members of his household to celebrate Christmas and throwing out the small tokens they had secretly bought) and intellectual dishonesty (e.g. in refusing for religious reasons alone to accept Darwinism when all his evidence pointed towards it).

The original views of Darby which were perpetuated by the Exclusive Brethren were somewhat as follows. Christianity has fallen from New Testament purity and all Christendom and every Church is corrupt and has incurred God's displeasure notably by establishing ministerial offices which hinder the believer's approach to God. Ministers should not be officials but possess special gifts (Charismata) granted from above and assumed by the Holy Ghost according to his will. These Charismata have no connection whatever with any official posts although in some cases they may coincide with them. The whole doctrine of the Brethren is based on the need for direct access to God and the rejection of any intermediate agency such as priests, ministers or presbytery. The Exclusive Brethren adopted new harsh rules in 1985 designed to prevent Saints (members) from having any contact with Sinners (non members). Members sharing homes with non members were to be expelled, members must declare their bank balances, unmarried members single or widowed must marry as soon as possible within the sect.

Today the majority of Brethren belong to the Open Brethren assemblies and unlike the Exclusives hold that the Lord's Supper is a commemorative act of breaking the bread observed once a week, is for all Christians who care to join them. Baptism is required and Brethren believe in the personal premillennial second coming of Christ.

Poltergeist allegedly a noisy type of spirit which specialises in throwing things about making loud thumpings and bangings and occasionally bringing in apparitions etc. Objects from elsewhere. Most so-called poltergeist activities are plain frauds, but the others are almost invariably associated with the presence in the house of someone (often, but not always a child) who is suffering from severe mental conflicts usually of a sexual nature. The inference is that those activities which are not simply fraudulent are either due to some unknown influence exerted by such mentally abnormal people or that they are actually carried out by ordinary physical means by such people when in a state of hysterical dissociation—i.e. unconsciously. The second hypothesis is much the more probable. See *Psychic Research*.

Poltheism. See God and Man.

Positivism, also known as the Religion of Humanity was founded by Auguste Comte (1798-1857) a famous mathematician and philosopher born in Montpellier France. His views up to the end of the century attracted many and it would have been impossible throughout that time to read a book on philosophy or sociology that did not mention them, but today his significance is purely of historical interest. In his *Cours de Philosophie Positive* (1830) he put forward the thesis that mankind had seen three great stages in human thought: (1) the theological, during which man seeks for supernatural causes to explain nature and invents gods and devils; (2) the metaphysical, through which he thinks in terms of philosophical and metaphysical abstractions; (3) the last positive or scientific stage when he will proceed by experiment and objective observation to reach in time positive truth.

Broadly speaking there is little to complain of in this analysis for there does seem to have been some sort of general direction along these lines. However Comte was not satisfied with having reached this point and felt that his system demanded a religion and of course one that was scientific. This religion was to be the worship of Humanity in place of the personal Deity of earlier times, and for it he supplied not only a Positive Catechism but a treatise on Sociology in which he declared himself the High Priest of the cult. Since, as it stood, the religion was likely to appear somewhat abstract to many Comte drew up a list of historical characters whom he regarded as worthy of the same sort of adoration as Catholics accord to their saints. The new Church attracted few members, even among those who had a high regard for Comte's scientific work, and its only significant adherents were a small group of Oxford scholars and some in his own country. Frederic Harrison

was the best known English adherent and throughout his life continued to preach (cont.) doctrines in I order to diminish audience
Pragmatism a typically American school of philosophy which comes under the heading of what Bertrand Russell describes as a practical as opposed to a theoretical philosophy. Whereas the latter to which most of the great philosophical systems belong seeks disinterested knowledge for its own sake the former (a) regards action as the supreme good (b) considers happiness an effect and knowledge a mere instrument of successful activity.

The originator of pragmatism is usually considered to have been the psychologist William James (1842-1910) although he himself attributed its basic principles to his life long friend the American philosopher Charles Sanders Peirce (1839-1914). The other famous pragmatist is John Dewey best known in Europe for his works on education (for although American text books on philosophy express opinions to the contrary few educated people in Europe have any of the slightest interest in pragmatism and generally regard it as an eccentricity peculiar to Americans). James in his book *The Will to Believe* (1896) points out that we are often compelled to take a decision where no adequate theoretical grounds for a decision exist for even to do nothing is to decide. Thus in religion we have a right to adopt a believing attitude although not in intellectually fully convinced. We should believe truth and shun error but the failing of the sceptical philosopher is that he adheres only to the latter rule and thus fails to believe various truths which a less cautious man will accept. If believing truth and avoiding error are equally important then it is a good idea when we are presented with an alternative to believe one of the possibilities at will since we then have an even chance of being right whereas we have none if we suspend judgment. The function of philosophy according to James is to find out what difference it makes to the individual if a particular philosophy or world system is true.

An idea is true so long as to believe it is profitable to our lives and he adds the truth is only the expedient in our way of thinking in the long run and on the whole of course. Thus if the hypothesis of God works satisfactorily in the widest sense of the word it is true. Bertrand Russell's reply to this assertion is I have always found that the hypothesis of Santa Claus works satisfactorily in the widest sense of the word therefore Santa Claus exists is true although Santa Claus does not exist. Russell adds that James's concept of truth simply omits as unimportant the question whether God really is in His heaven. If He is a useful hypothesis that is enough. God the Architect of the Cosmos is forgotten all that is remembered is belief in God and its effects upon the creatures inhabiting our petty planet. No wonder the Pope condemned the pragmatic defence of religion.

Predestination See Calvinism

Presbyterianism a system of ecclesiastical government of the Protestant churches which look back to John Calvin as their Reformation leader. The ministry consists of presbyters who are all of equal rank. Its doctrinal standards are contained in the *Westminster Confession of Faith* (1647) which is in general accepted by English, Scottish and American Presbyterians as the most thorough and logical statement in existence of the Calvinist creed. The Church of Scotland is the leading Presbyterian church in the British Isles.

The Reformation in Scotland was preceded by the same sort of awareness of the moral corruption of the Roman Church as had happened elsewhere but for various political and emotional reasons, which need not be discussed here, the majority of the Scottish people (unlike the English who had been satisfied with the mere exchange of Crown for Pope) were determined on a fundamental change of doctrine, discipline and worship rather than a reform of manners. The church preachers had learned their Protestantism not from Luther but from Calvin and their leader John Knox had worked in Geneva with Calvin himself and was resolved

to introduce the system into Scotland. In 1557 the Lords of the Congregation signed the Common Bond (a e a bond or covenant) to maintain the blessed Word of God and his congregation against their enemies and demanded the right to worship as they had chosen. However the real date of the Scottish Reformation is August 1560 when Mary of Guise (the regent for Mary Queen of Scots who was not yet of age) died and the Estates met to settle their affairs without foreign pressure. The *Scotts Confession* was drawn up and signed by Knox and adopted by the Estates.

The ideas on which the Reformed Kirk was based are found in the *Scotts Confession*, the *Book of Discipline* and the *Book of Common Order*; the so called Knox's liturgy. Knox's liturgy the same as that used in Geneva but translated into English was used until James attempted to force in Anglican liturgy on the Kirk led to an abandonment of both in favour of free prayers.

The Presbyterian tradition includes uncompromising stress upon the Word of God as contained in the Scriptures of the Old and New Testaments as the supreme rule of faith and life and upon the value of a highly trained ministry which has given the Church of Scotland a high reputation for scholarship and has in turn influenced the standard of education in Scotland. The unity of the Church is guaranteed by providing for democratic representation in a hierarchy of courts (until the Anglican Church which is a hierarchy of persons). The local kirk session consists of the minister and popularly elected elders (laymen). Ministers elected by their flocks are ordained by presbyters (ministers already ordained). Above the kirk session is the court of the presbytery which has jurisdiction over a specified area above that the court of synod which rules over many presbyteries and finally the General Assembly which is the Supreme Court of the Church with both judicial and legislative powers and over which the Moderator of the General Assembly presides. The function of the elders is to help the minister in the work and government of the kirk. The episcopacy set up by James VI and I and maintained by Charles I was brought to an end by the Glasgow Assembly (1638) but General Assemblies were abolished by Oliver Cromwell and at the Restoration Charles II re-established episcopacy. The Covenanters who resisted were hunted down imprisoned transported or executed over a period of nearly thirty years before William of Orange came to the throne and Presbyterianism was re-established (1690). Today Presbyterians no less than other Christian communities are looking at Christianity as a common world religion in the sense that the principles which unite them are greater than those which divide them. See Church of Scotland, Calvinism.

Protestant the name first applied to those who favoured the cause of Martin Luther and who protested against the intolerant decisions of the Catholic majority at the second Diet of Speyer (1529) revoking earlier decisions of the first Diet of Speyer tolerating the Reformers in certain cases (1526). In general the name

Protestant is applied to those Churches which severed connection with Rome at the time of the Reformation. The essence of Protestantism is the acceptance by the individual Christian of his direct responsibility to God rather than to the Church. See Lutheranism, Presbyterianism, Calvinism.

Psychedelism For all his recorded history man has relied upon drugs of one kind or another to make his life more tolerable. These have generally been central nervous system depressants—i.e. alcohol, hashish etc.—and their use in most societies has been brought under careful government control. Most societies have also at some stage experimented with the use of certain drugs of another class—the hallucinogens. These far from having the mentally tranquillising characteristics of small doses of alcohol provoke striking changes in mental alertness frequently coupled with visionary or hallucinatory experiences. The confusion and disorientation which accompany such states has

led to social disapproval of their use in Western countries and the favoured legal drug for centuries has been alcohol. In the 1960s the novelist Aldous Huxley in his essay *The Doors of Perception* wrote of his experiences with the drug mescaline, a derivative of the South American peyote and a powerful hallucinogen. Huxley put forward the hypothesis that mescaline had given him not only an entirely original psycho-logical experience but had also significantly heightened his perceptual ability—a development of the greatest possible interest to artists, writers and poets. Huxley's book had considerable impact stimulating other creative individuals into similar experiments not always with such euphoric results. In England the author Richard Ward reported some frightening moments under the drug LSD in his *A Drug taker's Notebook*, and Huxley amplified the unpredictable nature of the drug experience in *Heaven and Hell* published in 1956. Although such experiments were technically illegal, public interest had been considerably aroused and in the 1960s when it became easy to synthesise the most effective of the hallucinogens LSD its use began to be common among certain sections of society. In 1964 a sensational scandal rocked the great American university of Harvard when senior members of the teaching staff, including the psychology professor Timothy Leary, were dismissed for using LSD and encouraging students in its use. Unrepentant Dr Leary set up a community near New York from whence the cult of psychedelism was propagated.

Psychedelism—which is not really an organised system of belief but rather an attitude of mind—preaches that through the controlled use of drugs, particularly of the hallucinogenic variety, an individual may be made aware for the first time of the rich fields of experience which lie latent in the unconscious mind. The exploration of these territories will have both a liberating and an enriching effect the outcome being to turn on the individual to the total reality of mind. So convinced do many of the proponents of psychedelism become of the significance of the experience of the so-called LSD trip that they are inclined to urge non-trippers to experiment with the drug. Herein of course lies one obvious danger for the drug LSD is potentially a toxic substance which needs to be administered in minute doses if it is not to cause madness or even death. There is also much uncertainty about the possible long term effects of tripping. Many psychologists and scientists believing that it leads to a progressive disorientation and destruction of the personality, a disintegration of which the individual drug taker is seldom aware. If there is a credit side to psychedelism it may lie in the clear if limited evolution in popular music art, and design and to a lesser extent literature which has been inspired by these excursions. By the beginning of 1970 there was some sign that the wave of interest in LSD and similar drugs was beginning to slacken off, possibly because of an increasing awareness of the possible grievous side-effects and of the largely illusory nature of the insights which the trip is supposed to provide. Dr Leary the movement's leading figure is also reported to be turning his interest elsewhere, notably into the more staid and traditional waters of Maoism (q.v.).

Psychic Research, the scientific study of so-called psychic phenomena as contrasted with Spiritualism (q.v.) which is the cult of those who already believe in their supernatural nature. It is obviously impossible here to summarise work that has been carried out (in Britain notably by the Society for Psychical Research, founded in 1882) on such subjects as mediumship, apparitions, telepathy and clairvoyance (discussed here separately under the heading of Telepathy), poltergeists (also discussed separately), levitation, and precognition.

But the point at which we must begin is the human mind and the nature of scientific evidence and so far as these are concerned the following points may be made.

(1) There is little use in discussing psychic phenomena until we realise that almost no human being—least of all one with strong con-

victions—is a completely trustworthy witness. A person may be utterly honest in every other respect except that in which his convictions are involved.

(2) This does not mean that a witness is either telling the whole truth or is simply lying for the following possibilities exist: (a) he may be telling the truth; (b) he may be consciously lying for motives of his own; (c) his recollections may be incorrect in discussing something that happened in the past; (d) he may really believe that he saw or heard what he said he did and may be telling the truth as he experienced it—e.g. seeing a ghost—without realising that what he experienced is a product of his own unconscious mind; (e) there are various degrees of lying for the mind has a natural tendency to add coherence and meaning to the only partly coherent events of the day and it is a normal trait (consciously or unconsciously) to make a good story out of what originally were isolated and unconnected happenings; (f) even under the most favourable conditions the evidence of scientifically trained people is not as good as it might be; (g) the psychological experiment in which a class of students is suddenly exposed to a deliberately contrived scene—e.g. two men eccentrically dressed rush into the lecture room, exchange words, and have a quarrel—and the students are afterwards required to write down what they saw and heard—rarely 10 per cent being even 70 per cent correct as to what really happened).

(3) There are many aspects of psychic phenomena which are not psychic at all but based on well known scientific principles. How many people for example know (a) that every physical illness has its psychological aspect so that a person with chronic arthritis, let us say, may get up and walk for the first time in years after injection with a new drug which is later proved to be worthless or no better than aspirin (e.g. cortisone) yet if a spiritual healer got the same results he would be acclaimed for his psychic powers; (b) that it is possible to be completely paralysed, totally blind or deaf, have total loss of sensation in some part of the body, have two or more personalities, without any physical disease being present in the nervous (cured daily by psychiatrists without mystery) known as hysteria.

(4) It is possible under hypnosis or self hypnosis to produce stigmata—e.g. marks resembling the nail prints of the Crucifixion on hands and feet, to produce blisters at will, spontaneous bleeding, and many of the phenomena usually described as miraculous in the consulting room and by scientific means.

(5) We all have more potent senses than we ordinarily realise. We may not consciously know the number of steps leading to our flat but can be made under hypnosis to tell. Furthermore, there are people who are hypersensitive to hearing and vision (often without being aware of it) so that in thought-transference experiments where they are sent to another room whilst others decide on some object or idea, they may subconsciously hear what is going on or in card experiments in telepathy they may be able to read the face of the card reflected in the pupils of the sender, opposite or tell in a familiar pack which card is which from almost invisible differences on the backs of the cards.

(6) Most of us have no idea of the mathematical laws of probability and are therefore likely to misinterpret the mysteriousness of phenomena. Thus, suppose I have a premonition that someone has died and later find my feelings confirmed by the event then I may not remember or know (a) that on many previous occasions I, in common with most other people, have had premonitions the vast majority of which did not come true; (b) that on the last occasion I saw the person or from things I may have heard I may have unconsciously noted signs that all was not well and expected the event; (c) that the most improbable things happen quite normally (e.g. during the last war a flying bomb fell through the roof of the British Museum and failed to explode, and some time later a second flying bomb fell through the same hole and likewise

failed to explode) (d) that the chance of a pack of cards being dealt so that each of four persons receives a complete suit is exactly the same as the chance that any other combination of cards may come up.

(7) That collective hallucinosis does occur (it would be invidious to mention in detail certain miraculous happenings which might hurt the religious susceptibilities of many but we are entitled to ask how it is possible for the sun to stand still in the sky in the presence of thousands of people collected in a particular area when it is seen nowhere else in the world and has been noted by no astronomical laboratory?)

(8) Mediums have been proved to be prepared to do the most extraordinary things in order to deceive a suggestive audience seated in semi darkness—e.g. the so called ectoplasm (a supposedly psychic substance or materialisation) which exudes from the medium's body has been found before the seance as have apparitions or objects apparently appearing from nowhere—half way down the medium's throat or in the stomach ready to be regurgitated and even in other bodily apertures.

It is not maintained that psychic phenomena do not happen but that we must be extremely cautious in accepting the evidence of our own or even more other people's senses and much less free in our interpretation of what has been observed really means. See *Poltergeist Telepathy Spiritualism*.

Psychoanalysis an approach to the study of human personality involving the rigorous probing with the assistance of a specially trained practitioner of an individual's personal problems, motives, goals and attitudes to life in general. Often and quite understandably confused with psychology (of which it is merely a part) psychoanalysis has an interesting historical background and has attracted the interest of philosophers, scientists and medical experts since it emerged as a radical and controversial form of mental therapy at the turn of the century. The traditionally accepted founder is the great Austrian Sigmund Freud but he never failed to acknowledge the impetus that had been given to his own ideas by his talented friend the physiologist Joseph Breuer who for most of his working life had been interested in the curious phenomena associated with hypnosis. Breuer had successfully cured the hysterical paralysis of a young woman patient and had noticed that under hypnosis the girl seemed to be recalling emotional experiences hitherto forgotten which bore some relationship to the symptoms of her illness. Developing this with other patients Breuer then found that the mere recalling and discussing of the emotional events under hypnosis seemed to produce a dramatic alleviation of the symptoms—a phenomenon which came to be known as *catharsis*. Breuer also noticed another curious side effect: that his women patients felt embarrassingly and violently in love with him and he gradually dropped the practice of mental catharsis possibly feeling that it was a bit too dangerous to handle. This left the field clear for Freud whose brilliant mind began to search beyond the therapeutic aspects of the topic to see what light might be thrown on the nature of human personality and psychological mechanisms in general. The most important question concerned the forgotten emotional material which turned up apparently out of the blue during the hypnotic session. Freud rightly saw that this posed problems for the current theories of memory for how could something once forgotten (a) continue to have an effect on the individual without him being aware of it and (b) ultimately be brought back to conscious memory again. It must be remembered that at this time memory was considered to be a fairly simple process—information was stored in the brain and was gradually eroded or destroyed with the passage of time and the decay of brain cells. Once lost it was believed memories were gone for ever or at best only partially and inaccurately reproducible. Furthermore human beings were supposed to be rational (if frequent willful) creatures who never did anything without thinking about it (if only briefly) beforehand and without being well aware of their reasons

for so doing. It was within this framework that Freud had his great insight, one which many people believe to be one of the most important ideas given to mankind. This was simply the realisation that the human mind was not a simple entity controlling the brain and body more or less at will but a complex system made up of a number of integrated parts with at least two major subdivisions—the conscious and the unconscious. The former concerned itself with the normal round of human behaviour including the larger part of rational thought, conversation etc. and large areas of memory. The latter was principally devoted to the automatic control of bodily functions such as respiration, cardiac activity, various types of emotional behaviour not subject to much conscious modification and a large storehouse of relevant memories again not normally accessible to the conscious mind. Occasionally Freud proposed an exceedingly unpleasant emotional or otherwise painful event might be so troublesome if held in the conscious mind's store that it would get shoved down into the unconscious or repressed where it would cease to trouble the individual in his normal life. The advantages of this mechanism are obvious but they also brought with them hazards. With certain kinds of memory particularly those involving psychological rather than physical pain—as for example a severe sexual conflict or marital problem—repression might be used as a device to save the individual from facing his problem in the real world where he might be able ultimately to solve it by merely hiding it away in the unconscious and thus pretending it did not exist. Unfortunately Freud believed conflicts of this kind were not snuffed out when consigned to the basements of the mind but rather tended to smoulder on affecting the individual in various ways which he could not understand. Repressed marital conflicts might give rise to impotence for example or even to homosexual behaviour. Cult at improper social actions similarly repressed might provoke neurotic local paralysis etc. etc. Following this line of reasoning Freud argued that if the unwise repressed material could be dredged up and the individual forced to face the crisis instead of denying it then dramatic alleviations of symptoms and full recovery should follow.

To the great psychologist and his growing band of followers the stage seemed to be set for a dramatic breakthrough not only in mental therapy but also in a general understanding of the nature of human personality. To his pleasure—for various reasons he was never too happy about hypnosis—Freud discovered that with due patience, skill and guidance an individual could be led to resurrect the material repressed in his unconscious mind in the normal as opposed to the hypnotic state. This technique involving long sessions consisting of intimate discussions between patient and therapist became known as psychoanalysis and it has steadily evolved from its experimental beginnings in the medical schools and universities of Vienna to being a major system of psychotherapy with a world-wide following and important theoretical connotations. Psychoanalysis as practised today consists of a number of meetings between doctor and patient in which the latter is slowly taught to approach and enter the territory of his subconscious mind and examine the strange and forgotten material within. A successful analysis it is claimed gives the individual greater insight into his own personality and a fuller understanding of the potent unconscious forces which are at work within him and in part dictating his goals.

Freud's initial ideas were of course tentative and meant to be so. He was however a didactic and forceful personality himself unwilling to compromise on many points which became controversial as the technique and practice of psychoanalysis developed. The outcome was that some of his early followers notably the equally brilliant Carl Jung and Alfred Adler broke away to found their own schools or versions of psychoanalysis with varying degrees of success. Today psychoanalysis is coming under increasingly critical scrutiny and its claims are being treated with a good deal of

reservation. Notable antagonists include the English psychologist Professor H. J. Eysenck who points out that there is little if any solid experimental data indicating that psychoanalysis is a valid method of treating or curing mental illness. Analysts respond by saying that their system is closer to an art than a craft and not amenable to routine scientific experiment. The controversy will no doubt continue for some time to come but whatever its validity as therapy the basic ideas behind psychoanalysis—notably the reality and power of the unconscious mind—are beyond question and have given human beings definite and major insights into the greatest enigma of all—the workings of the human mind. See also Section Q.

Pyramidology a curious belief that the dimensions of the Great Pyramid at Giza, if studied carefully, reveal principles of fundamental historical and religious significance. The perpetrator of this was a Victorian publisher John Taylor who discovered that if you divide the height of the pyramid into twice the side of its base you get a number very similar to π —a number of considerable mathematical importance. Later discoveries in the same vein include the finding that the base of the pyramid (when divided by the width of a single casing stone) equals exactly 365—number of days in the year. Many books have been written on the interpretation of the dimensions of the pyramid none of which has any scientific or archaeological validity. Pyramidology is simply a classic example of the well known fact that hunting through even a random array of numbers will turn up sequences which appear to be significant—always provided that one carefully selects the numbers one wants and turns a blind eye to those that one doesn't!

Pyrrhonism, a sceptical philosophy which doubts everything.

Q

Quakers See Friends The Society of.

Quartodeciman an early Christian community who celebrated the Easter festival on the 14th day of the month when the Jews celebrated their Passover. In consequence of the confusion caused the practice was condemned by the Council of Nicaea in 325.

Quietism, a doctrine of extreme asceticism and contemplative devotion, embodied in the works of Michael Molinos a 17th cent Spanish priest and condemned by Rome. It taught that the chief duty of man is to be occupied in the continual contemplation of God so as to become totally independent of outward circumstances and the influence of the senses. Quietists taught that when this stage of perfection is reached the soul has no further need for prayer and other external devotional practices. Similar doctrines have been taught in the Moslem and Hindu religions. See Yoga.

R

Racism, the doctrine that one race is inherently superior or inferior to others, one of the bases of racial prejudice. It has no connection whatever with the study of race as a concept, or the investigation of racial differences, which is a science practised by the physical anthropologist (who studies physical differences) or the social anthropologist (who studies cultural differences). Racism is simply a vulgar superstition believed in by the ignorant or mentally unbalanced and it may be categorically stated as a scientific fact that racial superiority is a myth believed in by no scientist of repute. See Sciences of Man, Section F Part V.

Radesthesia, the detection either by some psychic faculty or with special equipment of radiations alleged to be given off by all living things and natural substances such as water, oil, metal, etc. The word radesthesia is in fact a fancy modern name for the ancient practice of

dowsing whereby an individual is supposed to be able to detect the presence of hidden underground water by following the movements of a hazel twig held in his hands. Dowsers or water diviners as they are sometimes called claim also to be able to detect the presence of minerals and hard though it may seem to believe have actually been hired by major oil companies to prospect for desert wells—though without any notable successes. The theory of dowsing is that all things give off a unique radiation signal which the trained individual (via his twig pendulum or whatever) can tune in to a theory which while not backed up by any data known to orthodox sciences, is at least not too fantastically far fetched. It is when radiesthetists claim to be able to detect the presence of oil water or precious metals by holding their pendulum over a map of the territory and declare that it is not necessary for them to visit the area in person to find the required spot that the topic moves from the remotely possible to the absurdly improbable. Some practitioners of this art state that they are able to perform even more marvellous feats such as determining the sex of chickens while still in the egg or diagnosing illness by studying the movements of a pendulum held over a blood sample from the sick individual. Such claims when put to simple scientific test have almost invariably turned out as fiascos. Yet belief in dowsing water divining and the like is still very widespread.

There is an important link between radiesthesia and the pseudo science of *radioous* which holds that the twig or pendulum can be superseded by complicated equipment built vaguely according to electronic principles. A typical radionic device consists of a box covered with knobs dials etc. by which the practitioner tunes in to the vibration given off by an object such as a blood spot, a piece of hair or even a signature. By the proper interpretation of the readings from the equipment the illness or even the mental state of the individual whose blood hair or signature is being tested may be ascertained. The originator of radionics seems to have been a Dr Albert Abrams who engaged in medical practice using radionic devices in America in the 1920s and 30s. The principal exponent in this country was the late George de la Warr who manufactured radionic boxes for diagnosis and treatment of illnesses and even a camera which he believed to be capable of photographing thought. In a sensational court case in 1960 a woman who had purchased one of the diagnostic devices sued de la Warr for fraud. After a long trial the case was dismissed the Judge commenting that while he had no good evidence that the device worked as claimed he felt that de la Warr sincerely believed in its validity and thus was not guilty of fraud or misrepresentation. Some practitioners hold this as in some way justifying or accrediting the science of radionics but most observers feel that the case was more a triumph for British justice and the right of the individual to promote his beliefs whatever they may be—provided they are sincerely held and do no obvious social harm.

Ranters, a derivative term for the Primitive Methodists (see Methodism).

Rationalism is defined as the treating of reason as the ultimate authority in religion and the rejection of doctrines not consonant with reason. In practice rationalism has a double significance: (1) the doctrine as defined above and (2) a 19th cent movement which was given to what was then known as free-thought, secularism or agnosticism—i.e. it was in the positive sense anti religious and was represented by various bodies such as the Secular Society the National Secular Society and the Rationalist Press Association (founded in 1899).

In the first sense which implies a particular philosophical attitude to the universe and life rationalism is not easy to pin down although at first sight it would appear that nothing could be simpler. Does it mean the use of pure reason and logic or does it mean, on the other hand, the use of what is generally called the "scientific method" based on observation (i.e. the evidence of our senses) and experiment? If we

are thinking in terms of the use of pure reason and logic then the Roman Catholic Church throughout most of its history has maintained not that the whole truth about religion can be discovered by reason but as St Thomas Aquinas held the basis of religion—*e.g.* the existence of God—can be rationally demonstrated. Nobody could have made more use of logic than the schoolmen of the Middle Ages yet not many people today would accept their conclusions nor would many non Catholics accept St Thomas's proofs of the existence of God even when they themselves are religious. The arguments of a first Cause or Prime Mover or the argument from Design on the whole leave us unmoved partly because they do not lead us to the idea of a *personal God* partly because we rightly distrust logic and pure reason divorced from facts and know that if we begin from the wrong assumptions or premises we can arrive at some very strange answers. If the existence of a Deity can be proved by reason then one can also by the use of reason come to the conclusions or rather paradoxes such as the following: God is by definition all good, all knowing, all powerful—yet evil exists (because if it does not exist then it cannot be wrong to say there is no God). But if evil exists then it must do so either because of God (in which case He is not all good) or in spite of God (in which case He is not all powerful).

Arguments of this sort do not appeal to the modern mind for two historical reasons: (1) many of us have been brought up in the Protestant tradition which—at least in one of its aspects—insists that we must believe in God by faith rather than by logic and in its extreme form insists that God as revealed by the inner light. (2) our increasing trust in the scientific method by direct observation and experiment. Thus no matter what Aristotle or St Thomas may say about a Prime Mover or a First Cause we remain unconvinced since at least one scientific theory suggests that the universe did not have a beginning and if scientific investigation proved this to be so then we should be entirely in different to what formal logic had to say.

The secularist and rationalist movements of the 19th cent were anti religious—and quite rightly so—because at that time there were serious disabilities imposed even in Britain by the Established Church on atheism or agnosticism and freedom of thought. They are of little significance now because very little is left largely thanks to their efforts of these disabilities.

Finally although most people are likely to accept the scientific method as the main means of discovering truth there are other factors which equally make us doubt the value of pure logic and reason unaided by observation. The first of these is the influence of Freud which shows that much of our reasoning is mere rationalising—*e.g.* we are more likely to become atheists because we hated our father than because we can prove that there is no God. The second is the influence of a movement in philosophy which, in the form of logical positivism or logical analysis, makes us doubt whether metaphysical systems have any meaning at all. To day instead of asking ourselves whether Plato was right or wrong we are much more likely to ask whether he did anything but make for the most part meaningless noises. Religion is in a sense much safer today than it ever was in the 19th cent when it made foolish statements over matters of science that could be proved wrong now we tend to see it as an emotional attitude to the universe or God (a feeling of being at home in the universe as William James put it) which can no more be proved or disproved than being in love.

Realism is a word which has so many meanings, and such contradictory ones, in various spheres, that it is difficult to define. We shall limit ourselves to its significance in philosophy. In philosophy 'realism' has two different meanings, diametrically opposed. (1) The most usual meaning is the one we should least expect from the everyday sense of the word—*i.e.* it refers to all those philosophies from Plato onwards which maintained that the world of appearance is illusory and that ideas forms or

universals are the only true realities belonging to the world beyond matter and appearance—the world of God or mind. In early mediaeval times St Thomas Aquinas was the chief exponent of this doctrine which was held by the scholastics as opposed to the Nominalists (*q.v.*) (2) In its modern everyday meaning 'realism' is the belief that the universe is real and not a creation of mind that although all we really experience is the evidence of our senses there is a reality that causes the appearance, the thing in itself as Kant described it. Material things may not really be what they appear to be (*e.g.* a noise is not the bang we experience but a series of shock waves passing through the atmosphere) yet for all that we can be sure that matter exists and it is very possible (some might add) that mind does not.

Reformation, the great religious movement of the 16th cent which resulted in the establishment of Protestantism. John Wyclif (d. 1384) John Hus (d. 1415) and others had sounded the warning note and when later on Luther took up the cause in Germany and Zwingli in Switzerland adherents soon became numerous. The whole sale ending of indulgences by the papal agents had incensed the people and when Luther denounced these things he spoke to willing ears. After much controversy the reformers boldly propounded the principles of the new doctrine and the struggle for religious supremacy grew bitter. They claimed justification (salvation) by faith and the use as well as the authority of the Scriptures rejecting the doctrine of transubstantiation, the adoration of the Virgin and Saints and the headship of the Pope. Luther was excommunicated. But the Reformation principles spread and ultimately a great part of Germany as well as Switzerland, the Low Countries, Scandinavia, England and Scotland were won over to the new faith. In England Henry VIII readily espoused the cause of the Reformation, his own personal quarrel with the Pope acting as an incentive. Under Mary there was a brief and sanguinary reaction, but Elizabeth gave completeness to the work which her father had initiated. See Lutheranism, Calvinism, Presbyterianism, Baptists, Methodism.

Reincarnation, the transmigration of souls. See Immortality, Hinduism, Buddhism.

Renaissance is defined in the *Oxford English Dictionary* as 'The revival of art and letters under the influence of classical models which began in Italy in the 14th century. It is a term which must be used with care for the following reasons: (1) Although it was first used in the form *rinascita* (re-birth) by Vasari in 1550 and people living at that time certainly were aware that something new was happening, the word had no wide currency until used by the Swiss historian Jacob Burckhardt in his classic *The Civilization of the Renaissance in Italy* (1860). (2) The term as used today refers not only to art in its widest sense but to a total change in man's outlook on life which extended into philosophical, scientific, economic and technical fields. (3) Spreading from Italy there were renaissance movements in France, Spain, Germany and northern Europe, all widely different with varying delays in time. As the historian Edith Sichel says: 'Out of the Italian Renaissance there issued a new born art, out of the Northern Renaissance there came forth a new born religion. There came forth also a great school of poetry and a drama the greatest that the world had seen since the days of Greece. The religion was the offspring of Germany and the poetry that of England.'

The real cause of the Renaissance was not the fall of Constantinople, the invention of printing, the discovery of America, though these were phases in the process, it was quite simply money. The rise of a new merchant class gave rise to individualist attitudes in economic affairs which prepared the way for individualism and humanism. The new wealthy class in time became patrons of the arts whereas previously the Church had been the sole patron and controller. Thus the artist became more free to express himself more respected, and being more well-to-do could afford to ignore the Church and even in time the views of his patrons.

It is true that art continued to serve to a con

siderable extent the purposes of faith but it was judged from the standpoint of art. Medieval art was meant to elevate and teach man. The Renaissance art to delight his senses and enrich his life. From this free and questing spirit acquired from economic individualism came the rise of modern science and technology here. Italy learned much from the Arab scholars who had translated and commented upon the philosophical medical and mathematical texts of antiquity while denying themselves any interest in Greek art and literature. Arabic Latin versions of Aristotle were in use well into the 16th cent. The Byzantine culture though it had preserved the Greek tradition and gave supremacy to Plato had made no move forward. But the Greek scholars who fled to Italy after the fall of Constantinople brought with them an immense cargo of classical manuscripts. The recovery of these Greek masterpieces, their translation into the vernaculars and the invention of printing made possible a complete understanding of the Greek spirit. It was the bringing together of the two heritages Greek science and Greek literature that gave birth to a new vision. But it was not only Aristotle and Plato who were being studied but Ovid Catullus Horace Pliny and Lucretius. What interested Renaissance man was the humanism of the Latin writers, their attitude to science, their scepticism.

The period c 1400-1500 is known as the Early Renaissance. During this time such painters as Masaccio, Giotto, Piero della Francesca, Botticelli and Giovanni Bellini were laying the foundations of drawing and painting for all subsequent periods including our own. They concerned themselves with such problems as anatomy, composition, perspective and representation of space, creating in effect a grammar or textbook of visual expression. The term High Renaissance is reserved for a very brief period when a pure, balanced classical harmony was achieved and artists were in complete control of the techniques learned earlier. The High Renaissance lasted only from c 1500 to 1527 (the date of the sack of Rome), yet that interval included the earlier works of Michelangelo, most of Leonardo's and all the Roman works of Raphael.

Ritualism, a tendency which during the 19th cent. developed in the High Church section of the Church of England to make use of those vestments, candles, incense etc. which are usually regarded as features of the Church of Rome. Since some opposition was aroused a Ritual Commission was appointed in 1904 to take evidence and try to find some common basis on which High and Low Church could agree with respect to ceremonial. The report of 1906 in effect recommended the giving of greater powers to bishops to suppress objectionable practices. Although they are often associated together it is worth while pointing out that there was no special connection between the Oxford Movement or Tractarians (q.v.) and Ritualism because Pusey disliked ritual and even Newman who eventually went over to Rome held extremely simple services at his church of St. Mary's.

Roman Catholic Church, the Christian organisation which acknowledges the Pope as the lawful successor of St. Peter, the apostle appointed by Christ to be the head of His Church. The reforming impulse at the Second Vatican Council (1962-6) has set in train great movements towards religious unity and the reform and modernisation of the Roman Catholic Church.

Romantic Movement or Romanticism is the name given not so much to an individual way of thinking but to the gradual but radical transformation of basic human values that occurred in the Western world round about the latter part of the 18th cent. It was a great break through in European consciousness and arose through the writings of certain men living during the half-century or more following say 1760. It arose then because both time and place were propitious for the birth of these new ideas. There was a revolution in basic values—in art, morals, politics, religion, etc. The new view was of a world transcending the old one infinitely larger and more varied.

To understand the Romantic movement it is

necessary first to take note of the climate of thought preceding the great change. Then to account for its beginning in Germany where it did (see FETTERISM) during the latter part of the 18th cent. and finally to appraise the writings of those men whose ideas fermented the new awakening. Briefly the shift was away from French classicism and from belief in the all pervasive power of human reason (the Enlightenment) towards the unfettered freedom that the new consciousness was able to engender. What mattered was to live a passionate and vigorous life to dedicate oneself to an ideal no matter what the cost (e.g. Byron).

The ideas of the Enlightenment (e.g. Fontenelle, Voltaire, Montesquieu) had been attacked by the Germans Hamann and Herder and by the ideas of the English philosopher Hume but Kant, Schiller and Fichte. Goethe's novel *Wilhelm Meister* and the French Revolution all had profound effects on the aesthetic, moral, social and political thought of the time. Friedrich Schlegel (1772-1829) said: 'There is in man a terrible unsatisfied desire to soar into infinity, a feverish longing to break through the narrow bonds of individuality.' Romanticism undermined the notion that in matters of value there are objective criteria which operate between men. Henceforth there was to be a resurgence of the human spirit, deep and profound that is still going on.

Rotarianism. The Rotary Club is primarily an American association but has many members in Britain and presumably elsewhere since all Rotary Clubs are united in an international organisation. It consists of groups of business and professional men formed with the purpose of serving their community and humanity in general. The name is derived from the clubs' entertaining in rotation.

S

Sabellian heresy. During the 4th cent. great controversies raged within the Christian Church over the divinity of Jesus Christ. Arius (see Arianism) denied Christ's divinity and maintained that the Father alone was truly divine. This doctrine was condemned at the Council of Nicea (325). Arius being opposed by Athanasius who held the now orthodox view of the Trinity which was reaffirmed at the Council of Constantinople (381). The Sabellians named after their founder Sabellius (fl. 215) a Libyan priest and theologian held the view that God is indivisible but with three roles appearing successively as the Father (the creator), as the Son (the redeemer) and as the Holy Spirit (the divine spirit within men). This view which makes the person of Jesus Christ ultimately an illusion was condemned.

Salvation Army. The religious movement which in 1878 became known by this name arose from the Christian Mission meetings which the Rev. William Booth and his devoted wife had held in the East End of London for the previous thirteen years. Its primary aim was and still is to preach the gospel of Jesus Christ to men and women untouched by ordinary religious efforts. The founder devoted his life to the salvation of the submerged classes whose conditions at that time were unspeakably dreadful. Originally his aim had been to convert people and then send them on to the churches, but he soon found that few religious bodies would accept these low-class men and women. So it was that social work became part of their effort. Practical help like the provision of soup kitchens accompanied spiritual ministrations. Soon in the interests of more effective warfare against social evils a military form of organisation, with uniforms, brass bands, and religious songs, was introduced. Its magazine *The War Cry* gave as its aim 'to carry the Blood of Christ and the Fire of the Holy Ghost into every part of the world. There were persecutions, mobs, sometimes encouraged by the police, assaulted the Salvationists who although not the aggressors, were often pushed by the magistrates. General Booth saw with

blinding clarity that conversion must be accompanied by an improvement of external conditions. Various books had earlier described the terrible conditions of the slums but in 1890 he produced a monumental survey entitled *In Darkest England and the Way Out*. From that time forward the Army was accepted and its facilities made use of by the authorities. To day the Army's spiritual and social activities have spread to countries all over the world every one no matter what class colour or creed he belongs to is a brother for whom Christ died.

Sandemanians or Glassites an obscure religious sect whose sole claim to fame is that one of its members was the great Michael Faraday founder of the science of electromagnetism, who never failed to attend its Sunday services.

Sceptics From Thales of Miletus (c 624-556 B.C.) to the Stoics in the 4th cent. B.C. philosophers had been trying to explain the nature of the universe each one produced a different theory and each could apparently prove that he was right. On diversity of views came the Sceptic school founded by Pyrrho (c 360-270 B.C.) that man is unable to know the real nature of the world or how it came into being. In place of a futile search for what must be forever unknowable the Sceptics recommended that men should be practical follow custom and accept the evidence of their senses.

Schoolmen From the time of Augustine to the middle of the 9th cent. philosophy like science was dead or merely a repetition of what had gone before. But about that time there arose a new interest in the subject although (since by then Western Europe was entirely under the authority of the Catholic Church) the main form it took was an attempt to justify Church teaching in the light of Greek philosophy. Those who made this attempt to reconcile Christian beliefs with the best in Plato and Aristotle were known as schoolmen and the philosophies which they developed were known as scholasticism. Among the most famous schoolmen may be counted John Scotus Erigena (c 800-c 877) born in Ireland and probably the earliest St. Anselm, archbishop of Canterbury (1033-1109), the great Peter Abelard whose school was in Paris (1079-1142), Bernard of Chartres his contemporary and the best known of all St. Thomas Aquinas of Naples (1226-74) who was given the name of the Angelic Doctor.

The philosophies of these men are discussed under various headings (God and Man, Determinism and Free-will) but being severely limited by the Church their doctrines differed from each other much less than those of later philosophical schools. However one of the great arguments was between the orthodox Realists (q.v.) and the Nominalists (q.v.) and a second was between the Thomists (or followers of St. Thomas Aquinas) and the Scotists (followers of John Scotus Erigena—not to be confused with John Scotus Brigena). The two latter schools were known as the Ancients, whilst the followers of William of Occam the Nominalist were known as the Terminalists. All became reconciled in 1482 in face of the threat from humanism of which the great exponent was Erasmus of Rotterdam (1466-1536) who hated scholasticism.

Scientology an unusual quasi philosophical system started by the American science fiction writer L. Ron Hubbard which claims to be able to effect dramatic improvement in the mental and physical well-being of its adherents. Originally developed in the United States as Dianetics the modern science of mental health it was hailed in Hubbard's first book to be a milestone for Man comparable to his discovery of fire and superior to his inventions of the wheel and the arch. Such extravagant statements exemplify the literature of the movement which in the late 1950s began to expand in England when its founder came to live in East Grinstead. Followers of Dianetics and Scientology advance within the cult through a series of levels or grades, most reached by undertaking courses of training and tuition payment for which may amount to hundreds and, in total even thousands of pounds. These

courses consist largely of specialised and complex mental exercises based on Hubbard's own variation of psychology and known as process and auditing. One of the principal goals of a Scientologist is the attainment of the state known as Clear (roughly speaking one cleared of certain mental and physical handicaps) when it is believed he (she) will be a literally superior being equipped with a higher intelligence and a greater command over the pattern of his (her) own life.

Orthodox psychologists tend to view both the practice and theory of Scientology with considerable misgivings and in the state of Victoria Australia the practice of Scientology is banned following a parliamentary inquiry under K. V. Anderson Q.C. who described it as a serious threat to the community medically morally and socially. In 1967 the Home Office announced that they would refuse Mr. Hubbard re entry to Britain that its centres would no longer be recognised as educational establishments and foreigners arriving for its courses would not be granted student status.

Scientology has for some time been registered across the world as a Church and its followers may attend religious services modelled on the movement's philosophy.

Shakers members of a revivalist group styled by themselves The United Society of Believers in Christ's Second Appearing who seceded from Quakerism in 1747 though adhering to many of the Quaker tenets. The community was joined in 1758 by Ann Lee a young convert from Manchester who had revelations that she was the female Christ. Mother Ann was accepted as their leader. Under her influence of her prophetic visions she set out with nine followers for Immanuel land in America and the community settled near Albany capital of New York state. They were known as the Shakers in ridicule because they were given to involuntary movements in moments of religious ecstasy.

Central to their faith was the belief in the dual role of God through the male and female Christ, the male principle came to earth in Jesus the female principle in Mother Ann. The sexes were equal and women preached as often as men at their meetings which sometimes included sacred dances—nevertheless the two sexes even in dancing kept apart. Their communistic way of living brought them economic prosperity the Shakers becoming known as good agriculturists and craftsmen, noted for their furniture and textiles. After 1800 however the movement began to decline and few if any are active today.

Shamans the medicine men found in all primitive societies who used their magical arts to work cures and protect the group from evil influences. The shaman was a man apart and wore special garments to show his authority. Shamanism with its magical practices, incantations, trances, exhausting dances, and self torture is practised even today by tribes that have survived in a primitive state of culture.

Shiites or Shia a heretical Moslem sect in Persia opposed by the orthodox Sunnites. The dispute, which came almost immediately after the death of the Prophet and led to bitter feuds, had little to do with matters of doctrine as such but with the succession. After Mohammed's death there were three possible claimants. Ali the husband of his daughter Fatima, and two others one of whom gave up his claim in favour of the other Omar. The orthodox selected Omar who was shortly assassinated and the same happened to his successor as Ali was passed over again. The Shiites are those who maintain that Ali was the true vicar of the Prophet, and that the three orthodox predecessors were usurpers.

Shintoism, the native religion of Japan, primarily a system of nature and ancestor worship. After the defeat of Japan in the second world war Hirohito disavowed his divinity as ancestor of the Sun goddess.

Sikhism The Sikh community of the Punjab which has played a significant part in the history of modern India, came into being during a period of religious revival in India in the 16th and 17th cent. It was originally founded as a religious sect by Guru (teacher) Nanak (1469-

1538) who emphasised the fundamental truth of all religions, and whose mission was to put an end to religious conflict. He condemned the formalism both of Hinduism and Islam, preaching the gospel of universal toleration and the unity of the Godhead, which He called Allah, Vishnu or God. His ideas were welcomed by the great Mogul Emperor Akbar (1542-1605). Thus a succession of Gurus were able to live in peace after Nanak's death; they established the great Sikh centre at Amritsar, compiled the sacred writings known as the *Adi Granth*, and improved their organisation as a sect. But the peace did not last long for an emperor arose who was a fanatical Moslem in face of whom the last Guru, Govind Singh (1666-1708) whose father was put to death for refusal to embrace Islam, had to make himself a warrior and mistle into the Sikhs a more aggressive spirit. A number of ceremonies were instituted by Govind Singh, admission to the fraternity was by special rite, caste distinctions were abolished, hair was worn long, the word *singh* meaning lion, was added to the original name. They were able to organise themselves into 12 *misl*s or confederacies but divisions appeared with the disappearance of a common enemy and it was not until the rise of Ranjit Singh (1780-1839) that a single powerful Sikh kingdom was established, its influence only being checked by the English, with whom a treaty of friendship was made. After the death of Ranjit Singh two Anglo-Sikh wars followed in 1845-46 and 1848-49 which resulted in British annexation of the Punjab and the end of Sikh independence. In the two world wars the Sikhs proved among the most loyal of British Indian subjects. The partitioning of the continent of India in 1947 into two states one predominantly Hindu and the other predominantly Moslem presented a considerable problem in the Punjab which was divided in such a way as to leave 2 million Sikhs in Pakistan, and a considerable number of Moslems in the Indian Punjab. Although numbering less than 2 per cent. of the population (c. 8 million) the Sikhs are a continuing factor in Indian political life. In 1966 the Punjab was divided on a linguistic basis—Punjabi speaking Punjab and Hindi speaking Haryana.

Socialism, a form of society in which men and women are not divided into opposing economic classes but live together under conditions of approximate social and economic equality using in common the means that lie to their hands of promoting social welfare. The brotherhood of man inspires the aims of socialism in foreign colonial social and economic policies alike. The word socialism first came into general use in England about 1834 in connection with Robert Owen's "village of co-operation" at New Lanark. About the middle of the 19th cent. Charles Kingsley and others established a form of Christian socialism, and William Morris, John Burns, and others founded a Socialist League in 1886. With the development of trade unions the socialist movement took a more practical trend. Fabianism (*q.v.*) associated in its early days with the names of Beatrice and Sidney Webb and George Bernard Shaw aims at the gradual reorganisation of society by creating in intelligent public opinion by education and legislation. The British Labour Party believes in peaceful and constitutional change to socialism by democratic methods based upon popular consent. A democratic programme of planned economy and public ownership of certain vital industries and services were features of socialist government from 1945-51 together with a comprehensive system of social security. Further radical reforms in the interest of social justice and industrial efficiency were initiated by the socialist government during its six years of office 1964-70. See also Section C Part I.

Southcottians, followers of Joanna Southcott, who died in 1814 shortly after announcing that (although over 50) she was about to give birth to a divine human being named Siloh. Miss Southcott certainly produced all the symptoms of pregnancy and was even examined by the Royal physician who pronounced her unquestionably with child. Although she even went into labour no child, divine or other

wise appeared and she seems to have died of something rather close to a broken heart. Her interesting symptoms would today be classed as hysterical pregnancy—a not uncommon condition which may mimic real pregnancy in a remarkable way. Joanna's followers remained loyal to her memory however, and a tiny sect still survives to this day. Shortly before her death incidentally she handed to followers a number of locked and sealed boxes, which she indicated contained among other things the secret of the universe. These were only to be opened 100 years after her death and then in the presence of 12 bishops. In 1927 one of these boxes unexpectedly turned up and it was ceremoniously opened at the Carlton Hall before a public audience. The organisers had to make do with only one bishop as most of the country's senior clerics pronounced themselves to be too busy to attend. Perhaps it was just as well for Miss Southcott's marvelously box was found to contain only a few rare coins, a horse pistol, a woman's embroidered nightcap and a slightly improper novel *The Surprises of Love*. One of the most endearing qualities of Joanna Southcott must have been her sense of humour. It is difficult to decide which is the stranger phenomenon—Joanna or her followers.

Spiritualism is a religion which requires to be distinguished from psychical research (*q.v.*) which is a scientific attempt, carried on both by believers and non believers to investigate psychic phenomena including those not necessarily connected with spirits—*q.v.* telepathy or clairvoyance and precognition. As a religion (although for that matter the whole of history is filled with attempts to get in touch with the spirit world) Spiritualism begins with the American Andrew Jackson Davis who in 1847 published *Nature's Divine Revelations* a book which is still widely read. In this Davis states that on the death of the physical body the human spirit remains alive and moves on to one or another of a considerable range of worlds or spheres where it commences yet another stage of existence. Since the spirit has not died but exists with full (and possibly even expanded) consciousness there should be no reason Davis argues why it should not make its presence known to the beings it has temporarily left behind on earth. In 1847 the year of the publication of Davis's book, two young girls, Margaret and Kate Fox living in a farmhouse at Hydesville New York began apparently to act as unwitting mediums for attempts at such between worlds communication. The girls were the focus for strange rappings and bangs which it was alleged defied normal explanation and which spell out in the form of a simple alphabetical code, messages from the spirits of the dead. The Fox sisters were later to confess that they had produced the raps by trickery but by that time the fashion had spread across the world and before long mediums in all lands were issuing spirit communications (often in much more spectacular form). In the late 19th cent. Spiritualism went into a phase of great expansion and for various reasons attracted the attention of many scientists. Among these were Sir William Crookes, Sir Oliver Lodge, Professor Charles Richet, Alfred Russel Wallace to say nothing of the brilliant and shrewd creator of Sherlock Holmes, Sir Arthur Conan Doyle. Today many people find it astonishing that people of such brilliance should find the phenomena of the seance room of more than passing interest, but the commitment of the Victorian scientists is understandable if we realise that Spiritualists after all claim to do no more than demonstrate as fact what all Christians are called on to believe—that the human personality survives bodily death. Furthermore at the time of the late 19th cent. peak of Spiritualism, much less was known about human psychology and about the great limitations of sensory perception in typical seance conditions, when lights are dimmed or extinguished and an emotionally charged atmosphere generated. Today the most striking phenomena of the seance room—the alleged materialisation of spirit people and the production of such half spiritual half

physical substances as ectoplasm—are rarely if ever produced at Spiritualist meetings. Some say that the most probable explanation for this is that too many fraudulent mediums have been caught out and publicly exposed for the profession to be worth the risks. The movement today which still has a large and often articulate following now concentrates on the less controversial areas of mental mediumship, clairvoyance and the like, or on the very wide spread practice of spirit healing. Where people are not deliberately deluded by bogus mediums acting for monetary reward (a practice which largely died out with the death of ectoplasm), Spiritualism probably has an important role to play in the life of many people whose happiness has been removed by the death of a much loved relative or spouse. It certainly does not deserve the violent attacks that are often made on it by orthodox clergy who allege that Spiritualists are communicating not with the souls of the departed but with the devil or his emissaries. To many people today belief in the devil would be looked upon as somewhat odder than belief in the survival of the individual spirit after death.

State and Man. Most of the early civilisations such as those of Egypt and Babylonia were theocratic, that is to say they were arranged in a hierarchy with at the peak a king who was also an incarnation of the god. Needless to say in such circumstances there was no room for philosophising about the nature of the state and the relationship which ought to exist between state and citizens. As usual we have to turn to ancient Greece for the beginnings of thought about this problem. We do so as briefly as possible since in general it is only the later philosophers whose work has much contemporary interest and in any case most people today realise that the political philosophy of a particular time is bound to reflect the actual conditions prevailing then and as such is of mainly theoretical interest today.

The Greek Approach. The early pre-Socratic philosophers Democritus and the Pythagorean school for example held that the individual should subordinate himself to the whole; they had no doubt that the citizen's first duty was to the state. The Greeks until the time of Plato were not really thinking in terms of individual rights nor had they given much thought to what form the state should take—they simply accepted it. The first great attempt to describe the ideal state is to be found in Plato's *The Republic* which is referred to elsewhere (see Education). His pupil Aristotle did not try to form a utopia but made many comments on the nature of government. Thus while agreeing that the state was more important than any individual person he distinguished between good and bad states and pointed out that to the extent that the state does not enable its citizens to lead virtuous and useful lives it is evil. A good constitution must recognise the inequalities between human beings and confer on them rights according to their abilities; among these inequalities are those of personal ability, property, birth and status as freeman or slave. The best forms of rule were monarchy, aristocracy and democracy; the worst forms—tyranny, oligarchy (or rule of a powerful few), and ochlocracy (or mob rule). The later Greek thinkers of Hellenistic times held two opposed points of view. The Epicureans (q.v.) taught that all social life is based upon self-interest and we become members of a group for our own convenience; therefore there are no absolute rights and laws—what is good is what members decide at that time to be good, and when they change their minds the law must change too. Injustice is not an evil in any god-given sense; we behave justly simply because if injustice became the general rule we ourselves should suffer. The Stoics (q.v.) on the other hand held that the state must dominate the individual completely and everyone must carry out first and foremost his social duties and be willing to sacrifice everything for it, but the state of the Stoics was no narrowly national one but one that strove to become a universal brotherhood.

The Christian Approach. The orthodox Christian view is expressed in St. Augustine's

book *The City of God*. Here it is held that the church as the worldly incarnation of the City of God is to be supreme over the state and the head of the church is to be supreme over secular rulers. In addition it must be recognised that whilst the secular ruler can make mistakes the church does not since it is the representative of God's kingdom on earth.

The Secular State. During the Renaissance (q.v.) people began to think for themselves and the results of their cogitations were not always pleasant for it was during this time that many rulers petty and otherwise were seeking absolute authority. Two notable thinkers at this stage were Niccolò Machiavelli (1469–1527) in Italy and Thomas Hobbes (1588–1679) in England where of course the Renaissance arrived later in history. Both supported absolute monarchy against the former domination of the church. The name of Machiavelli has become a byword for any behaviour that is cunning and unscrupulous but he was not really as bad as he is usually painted. It is indeed true that in his book *The Prince* he showed in the greatest detail the methods by which a ruler could gain absolute control and destroy civic freedom, but this despotism was intended as merely a necessary intermediate stage towards his real idea which was a free united Italian nation wholly independent of the church. Hobbes was a materialist whose thesis was that man is naturally a ferocious animal whose basic impulse is war and pillage and the destruction of whatever stands in his way to gain his desires. But if he allowed him self to behave in this way his life would be made brutish and short, so he creates a society in which he voluntarily gives up many of his rights and hands them over to a powerful ruler in his own interest. But having done this he must obey even when the ruler is unjust as he has no right to complain because anything is better than a return to his natural state. The religion of the king must be the religion of the people and the only thing no ruler has the right to do is to cause a man to commit suicide or murder or to make him confess to a crime.

Locke. *Locke Live and Let Live.* John Locke (1632–1704) disagreed with these views. Man is naturally peaceful and co-operative and therefore social life comes readily to him. He sets up an authority in order to preserve the group and that is why laws are made, but the function of the state is strictly limited to maintaining the public good and beyond this men are to be left free. Therefore absolute power and the doctrine of the Divine Right of Kings were wrong because power ultimately rests with the people who have the right to make and break governments. It is also wrong that those who make the laws should be able to execute them. This is the important British doctrine of the separation of powers between the legislature and the executive which in Britain and America is regarded as one of the bases of democracy.

Rousseau's Social Doctrine. The only other views we need consider here are those of Jean Jacques Rousseau (1712–78) and Herbert Spencer (1820–1903) since the views of these two important intervening figures Hegel and Karl Marx are dealt with elsewhere (see Dialectical Materialism) and after Spencer we come to a stage where political philosophy begins to merge with sociology and the social sciences. Rousseau is a puzzling figure. On the one hand he has been hailed as the prophet of freedom and on the other as the father of modern totalitarianism. His book *Social Contract* (1762) begins with the words 'Man is born free and everywhere he is in chains.' He says that he is in favour not merely of democracy but of direct democracy in which everyone has to give his assent to all measures as in the Greek city states and in Geneva of which city he was a citizen. (This method is still in force in respect of some measures in the Swiss cantons.) Natural society is based on a social contract or mutual agreement and Rousseau speaks of a return to nature which would ensure the sovereignty of the people at all times. Thus far he seems to agree with Locke but soon we

find that he is more akin to Hobbes since (as we are learning in our own day) nothing is more tyrannical than the absolute rule of all the people. (Public opinion is more Hitlerian than Hitler.) As it turns out then, the social contract consists in the total alienation of each associate together with all his rights to the whole community and each of us puts his person and all his power in common under the supreme direction of the general will. Rousseau admired direct democracy in the small city state but if his doctrine is applied to large states then the general will becomes absolute. It is in this sense that he is regarded as the forerunner of totalitarianism. Herbert Spencer is quoted only as an example of the inappropriate application of a biological theory to social issues. Influenced by Darwin's thesis of natural selection he saw in society a struggle in which the fittest survived and the less fit perished. Each individual had the right to preserve himself but in the case of human beings this depended upon group life in which to some extent each individual is limited by the rights of others. But this should not go too far and he condemned the socialism of J S Mill which (a) would give over much protection to the unfit and (b) would give the state powers which it has no right to exercise. The best government is the least government. In accordance with Darwinism, competition is essential. Stoics, the followers of Zeno a Greek philosopher in the 4th cent. B.C. who received their name from the fact that they were taught in the Stoa, i.e. the Painted Porch of Athens. They believed that since the world is the creation of divine wisdom and is governed by divine law it is man's duty to accept his fate. Zeno conceived virtue to be the highest good and condemned the passions. (See God and Man State and Man Determinism and Free will for a more detailed account of their beliefs.)

Subud, a cultish movement surrounding the Japanese mystic P. Subuh which established its headquarters in England in 1958 and made newspaper headlines because of alleged miracle cures of both psychological and physical ills. The basis of Subud (which is a contraction of three Sanskrit words *Susila Budhi Dharma* meaning the right living of the soul) is a single spiritual exercise the *latihan* in which the individual comes into contact with or is overwhelmed by a metaphysical force of some kind which is supposed to produce great mental and physical changes. During the latihan people may make strange movements some violent and utter unusual cries or chants. Now better known in America than in Britain Subud did not live up to the expectations of its early followers many of whom were people of considerable intelligence and professional standing. It is of particular interest because it represents a unique incursion of a rather obscure Eastern cult into Western life and suggests again that there is growing dissatisfaction in many quarters with orthodox religion and its contribution to the philosophy of the modern world.

Sunnites the orthodox sect of Islam as contrasted with the Shites or Shia (q.v.)

Swedenborgianism. The Church of the New Jerusalem based on the writings of Emanuel Swedenborg (1688-1772) was founded by his followers eleven years after his death. The New Church is regarded by its members not as a sect but as a new dispensation bearing the same relationship to Christianity as Christianity does to Judaism.

Synchronicity an attempt by the psychologist Carl Gustav Jung to explain the apparently significant relationship between certain events in the physical universe which seem to have no obvious causal link. This rather involved concept is easily understood if one realises that almost all scientific and philosophical beliefs are based on the notion that the continuous process of change which is taking place in ourselves and in the universe around us is dependent upon a principle known as causality. We can express this another way by saying that an object moves because it has been pushed or pulled by another. We see because light strikes the retina and signals pass up the nervous

system to the brain. Aston's falls to the ground because the earth's gravity is pulling it towards its centre etc. etc. For all practical purposes every event can be looked upon as being caused by some other prior event and this is obviously one of the most important principles of the operation of the universe. Jung however felt that there is a sufficiently large body of evidence to suggest that events may be linked in a significant (i.e. non chance) way without there being any true causal relationship between them. The classic example he held to be the supposed predictive power of a tarology by which there appears to be a relationship between the stellar configurations and the personality and life pattern of individuals on earth. Jung was scientific enough to realise that there could be no causal connection between the aspect of the stars and the lives of people billions of miles from them yet felt the evidence for astrology was strong enough to demand an alternative non causal explanation. The trouble with synchronicity which has not made much impact on the world of physics or of psychology is that it is not really an explanation at all but merely a convenient word to describe some puzzling correspondences. The real question of course is whether there really are events occurring which are significantly but not causally linked and most scientists today would hold that there were probably not. It was typical of the bold and imaginative mind of Jung to tackle head on one of the principal mysteries of existence and come up with a hypothesis to attempt to meet it.

Syndicalism a form of socialist doctrine which aims at the ownership and control of all industries by the workers contrasted with the more conventional type of socialism which advocates ownership and control by the state. Since syndicalists have preferred to improve the conditions of the workers by direct action, e.g. strikes and working to rule rather than through the usual parliamentary procedures they have been closely related to anarchists (q.v.) and are sometimes described as anarcho-syndicalists. Under syndicalism there would be no state for the state would be replaced by a federation of units based on functional economic organisation rather than on geographical representation. The movement had bodies in the United Kingdom where guild socialism (q.v.) was strongly influenced by its doctrines in France, Germany Italy Spain Argentina and Mexico but these gradually declined after the first world war losing many members to the communists. Fascism (q.v.) was also strongly influenced by the revolutionary syndicalism of Georges Sorel in making use of his concept of the myth of the general strike as an emotional image or ideal goal to spur on the workers with Mussolini the myth became that of the state. Mussolini was also influenced by Sorel's doctrine of violence and the justification of force. Syndicalism had a certain influence in the Labour Party in its early days, but was crushed by men like Ernest Bevin who began to fear that by involving the workers in direct responsibility for their industries it would put them at a disadvantage when bargaining for wages.

T

Taoism, a religion which although in a degenerate state is still one of the great Eastern creeds. Its alleged founder Lao-tze is said to have been born in Honan about 604 B.C. he is also said to be the author of the bible of Taoism the *Tao-te-chang* or in English *The Way of Life* and to have disapproved of Confucius. This if true would hardly be surprising for Taoism is eminently a mystical religion recommending doing nothing and resisting nothing whereas Confucianism (q.v.) is eminently a practical code of living and its founder insisted on intervening in everything to do with social life. But the truth as revealed by modern scholarship is rather different. We are told that the poems of the *Tao-te-chang* are anonymous and probably originated among recluses in lonely valleys

long before the time of Confucius they were collected and given form at some time late in the 3rd cent B.C. and their authorship attributed to Lao tze. It is entirely possible that no such person ever existed (unlike Confucius who certainly did) but if there were such a man he appears to have used a pseudonym since Lao is not a surname but an adjective meaning old and it was customary to attribute important works to old men on account of their supposed wisdom. Lao tze simply means the old philosopher and although the *Tao te-ching* is one of the most remarkable and instructive books ever written it is as anonymous as the Border Ballads.

It is apparent that the religion learned both from the ancient Chinese mystics and from Brahmanism *Tao* the Way is impalpable invisible and incapable of being expressed in words. But it can be attained by virtue by compassion humility and non violence. Out of weakness comes true strength whereas violence is not only wrong but defeats its own ends. There is no personal God and such gods as men imagine are mere emanations of *Tao* which gives life to all things. *Tao* is Being. Worlds are worthless and internal renunciation is far better than anything that follows from the use of force because passive resistance convinces the other from within that he is in error whereas violence only compels the external appearance of conviction whilst inwardly the individual is as before. It is wealth to be content. It is willful to force one's way on others.

Later Lao tze became a divinity and indeed one of a Trinity each worshipped in the form of idols (which the founder had hated). Soon there was worship of the forces of nature, the stars, the ideas, the sun and moon and a thousand other deities among whom Confucius was one. The purest mysticism and wisdom had been utterly corrupted by contact with the world.

Telepathy and Clairvoyance Telepathy is the alleged communication between one mind and another other than through the ordinary sense channels. Clairvoyance is the supposed faculty of seeing objects or events which by reason of space and time or other causes are not discernible through the ordinary sense of vision. Such claims have been made from time immemorial but it was not until this century that the phenomena were investigated scientifically. The first studies were undertaken by the Society for Psychical Research which was founded in 1882 with Professor Henry Sidgwick as its first president. Since then it has carried out a scholarly programme of research without—in accordance with its constitution—coming to any corporate conclusions. In America the centre of this research was the Parapsychology Laboratory at Duke University (see Para psychology) where at one time it was claimed clear scientific evidence for extra sensory perception (ESP) had been obtained. These claims were treated with great reservation by the majority of scientists and today there is a sharply decreasing scientific interest in the field. **Theism** See God and Man.

Theosophy (Sanskrit *Brahma Vidya* = divine wisdom) a system of thought that draws on the mystical teachings of those who assert the spiritual nature of the universe and the divine nature of man. It insists that man is capable of intuitive insight into the nature of God. The way to wisdom or self knowledge is through the practice of Yoga (q.v.). Theosophy has close connections with Indian thought through Vedic Buddhist and Brahmanist literature. The Modern Theosophical Society was founded by Mme H. P. Blavatsky and others in 1875 and popularised by Mrs Annie Besant.

Tractarianism A Catholic revival movement, also known as the Oxford Movement (not to be confused with the so called Oxford Group) which had its beginnings at Oxford in 1833. The leaders included the Oxford high churchmen E. B. Pusey, J. Keble and J. H. Newman. Through the *Tracts for the Times* (1833-41) a series of pamphlets which were sent to every parsonage in England, they sought to expose the dangers which they considered to be threatening the church from secular authority. The immediate cause of the movement was the

Reform Act (1832) which meant that the state was no longer in the safe keeping of Tories and Churchmen but that power was falling into the hands of Liberals and Dissenters. They advocated a higher degree of ceremonial worship nearer the Roman communion. In *Tract 90* (the last) Newman showed how the Thirty nine Articles themselves which were regarded as the bulwark of Protestantism could be made to square with Roman doctrine. It was obvious which direction the movement was taking and the romanizing tendency was widely resented. In 1845 Newman went over to Rome. Pusey and Keble persisted in their efforts to secure recognition of Catholic liturgy and doctrine in the Anglican Church. Catholicism of the Anglican type (i.e. Catholic in ritual ceremony and everything save submission to the Pope) is termed Anglo Catholicism (q.v.). **Transmigration of Souls** See Immortality. **Buddhism** **Hinduism**

Transubstantiation the conversion in the Eucharist of the bread and wine into the body and blood of Christ—a doctrine of the Roman Catholic Church.

Trotskyism a form of communism supporting the views of Leon Trotsky the assumed name of Lev Bronstein (1879-1940) who in 1924 was ousted from power by Stalin and later exiled and assassinated in Mexico. Trotsky held that excessive Russian nationalism was incompatible with genuine international communism and that Stalin was concentrating on the economic development of the Soviet Union to an extent which could only lead to a bureaucratic state with a purely nationalist outlook. After the Hungarian uprising in 1956 which was ruthlessly suppressed by the Soviet Armed Forces a wave of resignations from Western Communist parties took place and many dissident elements taking to Trotskyism in its place.

U

Underground the name given to an increasingly well organised group mainly composed of young people university students etc. which propagates anti establishment and often highly controversial views. Its history and to some extent its aims are obscure but it is a force of increasing power in Western society and its evolution is worth watching with care. The 1960s have been years of great metamorphosis in Europe and America with rapid changes taking place in our attitudes to war and peace to sex and morals to marriage and family to church and state. For large sections of the population these changes have been too rapid and too radical by far but for others they have been too slow. In particular the liberalisation of the law on the so called soft drugs notably marijuana is advocated by a vocal and increasing minority of young people. The expression of their views has been finding outlet in magazines and newspapers privately published and printed which reach a wide circulation despite the disqualification of many newswriters to stock them. These publications, while frequently containing material of an obscene and many people highly offensive nature also contain articles features and poems by writers of repute many of whom contribute regularly to more orthodox publications and yet are sympathetic to the underground cause. The word underground here incidentally refers back to the underground press that published revolutionary material at great risk in Nazi occupied territories during the last war. With the exception of the risqué magazine *Private Eye* which is largely concerned with acid political satire the first of the genuine underground newsheets was the *International Times* (IT) which was followed in due course by *Oz* and *Rolling Stone*. All three papers are strongly anarchistic in flavour uneven in literary merit openly in favour of legalising marijuana ('pot') and generally quite scandalous to the middle class and middle aged. This is not the place to argue the pros and cons of the under

ground arguments nor to decide whether our permissive society has gone too far or not yet far enough. The important message that the appearance of the whole underground movement implies is that young people because of greater financial independence wider opportunities for travel better education and easier access to communication channels such as printing presses radio transmitters etc are beginning to make their admittedly controversial views more widely publicised. Further more this is a trend which will inevitably develop rather than diminish and in the absence of authoritarian repression these forces will have an increasing impact on our lives. *Serailo Weathermen*

Unitarianism has no special doctrines although clearly as the name indicates belief is in the simple personality of God. Unitarianism. This general statement however can be interpreted with varying degrees of subtlety. Thus unitarian belief may range from a sort of Arianism which accepts that although Christ was not of divine nature divine powers had been delegated to him by the Father to the simple belief that Christ was a man like anyone else and his goodness was of the same nature as that of many other great and good men. Indeed today many Unitarians deny belief in a personal God and interpret their religion in purely moral terms putting their faith in the value of love and the brotherhood of man. The Toleration Act (1689) excluded Unitarians but from 1813 they were legally tolerated in England. Nevertheless attempts were made to turn them out of their chapels on the ground that the preachers did not hold the views of the original founders of the endowments. But this ended with the Dissenting Chapels Act of 1845. In America no such difficulties existed and in the Boston of the 19th cent many of the great literary figures were openly unitarian both in belief and name. *e.g.* Emerson Longfellow Lowell and Oliver Wendell Holmes.

Utilitarianism, a school of moral philosophy of which the main proponents were J. S. Mill (1806-73) and Jeremy Bentham (1748-1832). Bentham based his ethical theory upon the utilitarian principle that the greatest happiness of the greatest number is the criterion of morality. What is good is pleasure or happiness what is bad is pain. If we act on this basis of self interest (pursuing what we believe to be our own happiness) then what we do will automatically be for the general good. The serious failing of this thesis is (1) that it makes no distinction between the quality of one pleasure and another and (2) that Bentham failed to see that the law might not be framed and administered by men as benevolent as himself. J. S. Mill accepted Bentham's position in general but seeing its failings emphasised (1) that self interest was an inadequate basis for utilitarianism and suggested that we should take as the real criterion of good the social consequences of the act (2) that some pleasures rank higher than others and held that those of the intellect are superior to those of the senses. Not only is the social factor emphasised but emphasis is also placed on the nature of the act.

Utopias. The name utopia is taken from a Greek word meaning nowhere and was first used in 1516 by Sir Thomas More (1478-1535) as the title of his book referring to a mythical island in the south Pacific where he sited his ideal society. Since then it has been used of any ideal or fanciful society and here a few will be mentioned. (The reader may recall that Samuel Butler's 19th cent novel, describing an imaginary society in New Zealand where criminals were treated and the sick punished, was entitled *Erewhon* which is the word nowhere in reverse.) It should be noted that not all utopias were entirely fanciful—*e.g.* Robert Owen's and François Fourier's beliefs, although found to be impractical, were, in fact, tried out.

Sir Thomas More More wrote at a time when the rise of the wool growing trade had resulted in farming land being turned over to pasture and there was a great wave of unemployment and a rise in crime among the dispossessed. More began to think in terms of the medieval

ideal of small co-operative communities in which class interests and personal gain played a decreasing part. A society which would have the welfare of the people at heart both from the physical and intellectual points of view. His utopia was one in which there was no private property because the desire for acquisition and private possessions lay at the root of human misery. There was therefore only common ownership of land and resources. Each class of worker was equipped to carry out its proper function in the economic scheme and each was fairly rewarded for its share in production so that there was neither wealth nor poverty to inspire conflict. Nobody was allowed to be idle until the time came for him to retire when he became free to enjoy whatever cultural pleasures he wished but since the system was devoid of the waste associated with competition the working day would be only six hours. There was to be compulsory schooling and free medical care for everybody. Full religious toleration complete equality of the sexes and a modern system of dealing with crime which was free from vindictiveness and cruelty. Government was to be simple and direct by democratically elected officials whose powers would be strictly limited and the public expenditure kept under close scrutiny. It will be seen that More was far in advance of his age and to most democratically minded people in advance of an earlier utopia. Plato's *Republic* which is described under the heading of Education.

James Harrington James Harrington published his book *The Commonwealth of Oceana* in 1656 and offered it to Oliver Cromwell for his consideration but without tangible results. Better than any other man of his time Harrington understood the nature of the economic revolution which was then taking place and like More saw the private ownership of land as the main cause of conflict. He put forward the theory that the control of property particularly in the shape of land determines the character of the political structure of the state. If property were universally distributed among the people the sentiment for its protection would naturally result in a republican form of government. The Commonwealth of Oceana was a society of laws and not of men—it was to be legally based and structured so as to be independent of the good or ill will of any individuals controlling it. Thus there must be a written constitution a two house legislature frequent elections with a secret ballot and separation of powers between legislature and executive—all today familiar features of parliamentary democracy but unique in his time.

Saint Simon The utopias of the late 18th and 19th cent came, of course into the period of the industrial revolution and of laissez faire capitalism. Individual enterprise and complete freedom of competition formed the outlook of the ruling class. Naturally the utopias of this period tended to have a strongly socialist tinge since such theories are obviously produced by those who are not satisfied with existing conditions. Saint Simon's *New Christianity* (1825) is one such and by many Claude Henri Comte de Saint Simon (1780-1825) is regarded as the founder of French socialism. His book urged a dedication of society to the principle of human brotherhood and a community which would be led by men of science motivated by wholly spiritual aims. Production property was to be nationalised (or socialised as he describes the process) and employed to serve the public good rather than private gain. The worker was to produce according to his capacity and to be rewarded on the basis of individual merit, the principle of inheritance was to be abolished since it denied the principle of reward for accomplishment on which the society was to be founded. Saint-Simon's proposals were not directed towards the poorer classes alone but to the conscience and intellect of all. He was deeply impressed with the productive power of the new machines and his scheme was, first and foremost intended as a method of directing that power to the betterment of humanity as a whole.

Fourier François Marie Charles Fourier (1772-1837) although by conviction a philo-

sophical anarchist who held that human beings are naturally good if allowed to follow their natural desires was the originator of what on the face of it one would suppose to be the most regretted of the utopias. It consisted of a system of phalanxes or co-operative communities each composed of a group of workers and technicians assured of a minimum income and sharing the surplus on an equitable basis. Agriculture was to be the chief occupation of each phalanx and industrial employment planned and so carefully assigned that work would become pleasant and creative rather than burdensome. One of his ideas was that necessary work should receive the highest pay, useful work the next and pleasant work the least pay. The land was to be scientifically cultivated and natural resources carefully conserved. Most of the members' property was to be privately owned but the ownership of each phalanx was to be widely diffused among members by the sale of shares. Such parasitic and unproductive occupations as stockbroker, soldier, economist, middle man and philosopher would be eliminated and the education of children carried out along vocational lines to train them for their future employment.

The strange thing was that Fourier's suggestions appealed to many both in Europe and the U.S.A. and such men (admittedly no economic or technical experts) as Emerson, Thoreau, James Russell Lowell and Nathaniel Hawthorne strongly supported them. An American Fourier colony known as Brook Farm was established and carried on for eight years when it was dissolved after a serious fire had destroyed most of its property.

Robert Owen. Robert Owen (1771-1858) a wealthy textile manufacturer and philanthropist established communities founded on a kind of utopian socialism in Lanarkshire, Hampshire and in America. Of his New Lanark community an American observer wrote: "There is not I apprehend to be found in any part of the world a manufacturing community in which so much order, good government, tranquility and rational happiness prevail. The workers in Lanark were given better housing and education for their children and it was administered as a co-operative self-supporting community in Scotland. Later in life Owen returned to sponsoring legislation that would remove some of the worst evils of industrial life in those days: reduction of the working day to twelve hours, prohibition of labour for children under the age of ten, public schools for elementary education and so on. But he lived to see few of his reforms adopted. He also promoted the creation of co-operative societies, the formation of trades unions, labour banks and exchanges, the workers' educational movement and even an Anglo-American federation. There can be no doubt that if he saw little result himself he left the imprint of his convictions to benefit future communities who may not even know his name."

V

Vitalism, the philosophical doctrine that the behaviour of the living organism is, at least in part, due to a vital principle which cannot possibly be explained wholly in terms of physics and chemistry. This belief was at one time held strongly by the late Professor C. E. M. Joad and is implicit in Henri Bergson's (1858-1941) theory of creative evolution. It was maintained by Bergson that evolution like the work of an artist is creative and therefore unpredictable, that a vague need exists beforehand within the animal or plant before the means of satisfying the need develops. Thus we might assume that sightless animals developed the need to become aware of objects before they were in physical contact with them and that this ultimately led to the origin of organs of sight. Earlier this century a form of vitalism described as emergent evolution was put forward. This theory maintains that when two or more simple entities come together there

may arise a new property which none of them previously possessed. Today biologists would say that it is the *arrangement* of atoms that counts, different arrangements exhibiting different properties and that biological organisation is an essentially dynamic affair involving the lapse of time.

W

Wahabism members of an Arabian sect of Islam which originated in the teaching of Muhammad Ibn Abd al Wahab born at the end of the 17th cent. He was deeply resentful of the Turkish rule which in addition to its tyranny had brought about innovations in the religion which Muhammad regarded as a perversion of its original form. He proceeded to reform Islam to its primitive conditions and impressed his beliefs on Mohammed Ibn Saud, a sheikh who spread them with the aid of his sword. Under the successors of Ibn Saud the power of the Wahabism spread over much of Arabia where it is dominant today in Saudi Arabia. Its particular characteristic is that it refuses to accept symbolic or mystical interpretations of the words of the Prophet and accepts quite literally the teaching of Islam. It is in fact a sort of Moslem fundamentalism. Although crushed by the Turks in 1811-15 the movement remains an important element in Mohammedanism.

Waldenses a movement also known as The Poor Men of Lyons, founded by Peteraldo of that city about the same time and in the same part of southern France as the Albigenses (*q.v.*) with whom however they had nothing in common. Their main belief was a return to Apostolic simplicity based on reading the Bible in their own language; their doctrines were somewhat similar to those of the Mennonites and the Quakers. However they did not wish to separate themselves from the Church and were originally protected by several popes until the Lateran Council of 1215 excluded them mainly for the crime of preaching without ecclesiastical permission. From this time they were subjected to persecution, yet maintained some contact with the Church until the Reformation when they chose to take the side of the Protestants. Situated mainly on the sides of the Alps, half in Piedmont and half in France, they were persecuted or not according to the contemporary political convenience of the Dukes of Savoy and the major attempt to destroy them came forth Oliver Cromwell's intervention and the famous sonnet of Milton. In spite of torture, murder, deportation, and even the kidnapping of their children, to have them brought up in the Roman Catholic faith the sect survived and still exists having been granted full equality of rights with his Roman Catholic subjects by Charles Edward of Piedmont in 1848.

Weathermen the rather incongruous name for the most radical and volatile of the many groups making up the so-called "underground" in the United States of America. Unlike most of the loosely structured organisations involved in the growing anti-establishment front the Weathermen appear to have direct rather than anarchistic political goals, taking a stand far to the left of traditional politics. Their avowed aim is the total overthrow of the current American political structure with specific and carefully planned acts of violence as the tools of their trade and the civil police force as one of their prime targets. This has led to a series of bomb explosions, often cunningly planned and brutal murders of police patrolmen which have deeply shocked the average American citizen. A particularly sinister and ominous feature to most people's eyes is the fact that the Weathermen appear to be largely drawn from the highly intelligent and well educated strata, many of them with well-to-do and/or academic backgrounds. Members of this group make no secret of their contempt for the intellect and political attitudes of the American middle-class and claim to demonstrate the impotence of Society by their ability to commit flagrant acts

of violence with such ease and the equal ease with which they subsequently escape detection and arrest. In 1970 one of the leaders of the Weathermen an attractive and dynamic woman university lecturer was placed on the FBI's notorious most wanted criminals list. The elusive nature of the organisation and its uncertainty in background have led to a number of fantastic speculations about its true origins. One of the oddest of these is the notion widely held in America that the Weathermen are a reality financed and backed by the country's extreme right—as a means of discrediting in the public eye the slow but steady move towards socialism that seems to be developing there. Such speculations serve really to remind one that the political structure of the United States remarkably stable for over a century is entering a confused and tortured revolutionary phase.

Witchcraft. There are various interpretations and definitions of witchcraft from that of Pennethorne Hughes who states that witchcraft, as it emerges into European history and literature represents the old paleolithic fertility cult plus the magical idea plus various parodies of contemporary religions to that of the fanatical Father Montague Summers who says that Spiritualism and witchcraft are the same thing. A leading authority on witchcraft however the late Dr Margaret Murray distinguishes between Operative Witchcraft (which is really Magic (qv)) and Ritual Witchcraft which she says embraces the religious beliefs and ritual of the people known in late mediaeval times as witches. That there were such people we know from history and we know too that many of them—the great majority of them women—were tortured or executed or both. Many innocent people perished, especially after the promulgation of the bull *Summus desiderantes* by Pope Innocent VIII in 1484. Himself a man of scandalous life according to a Catholic historian he wrote to his dear sons, the German professors of theology Johann Sprenger and Heinrich Kraemer, witches are hindering men from performing the sexual act and women from conceiving and delegated them as Inquisitors of these heretical practices. In 1494 they codified in the *Malleus Maleficarum* (Hammer of Witches) the ecclesiastical rules for detecting acts of witchcraft. Dr Murray points out that there have ordinarily been two theories about witchcraft. (1) that there were such beings as witches that they possessed supernatural powers and that the evidence given at their trials was substantially correct. (2) that the witches were simply poor silly creatures who either deluded themselves into believing that they had certain powers or more frequently were tortured into admitting things that they did not do. She herself accepts a third theory that there were such beings as witches, that they really did what they admitted to doing but that they did not possess supernatural powers. They were in fact believers in the old religion of pre-Christian times and the Church took centuries to root them out. That there existed covens of witches who carried out peculiar rites Dr Murray has no doubt whatever. The first to show that witchcraft was a superstition and that the majority of so-called witches were people suffering from mental illness was the physician Johann Weyer of Cleves (1515–88). His views were denounced by the Catholic Church. Few people realise how deeply the notion of witchcraft is implanted in our minds and how seriously its power is still taken. For example, the Witchcraft Act was not repealed in this country until the 1950s. Furthermore as recently as 1944 when the allied armies were invading Europe the Spiritualist medium Mrs Helen Duncan was charged with witchcraft and actually sent to prison—a prosecution which brought forth caustic comments from the then prime minister Winston Churchill. See also Demonism.

Women's Liberation Movement. The name given to a loosely organised collection of women drawn from all ages and walks of life which appears to be emerging as a latter-day suffragette movement. Unlike the original suffragette movement however which advo-

cated Votes for Women the 1970s version seems to have less definite aims. The principal argument hinges on the fact that with the development of highly efficient methods of contraception (the pill) women need no longer be slaves to their family commitments and the traditional dominant and decision making role of the male in our society must go. At the same time there should be no more wage or job discrimination against women. The movement is relatively strong in America and is acquiring some slight power in local and state politics.

World Congress of Faiths an inter religious movement which aims to break down barriers between faiths. The first step towards it was taken by the world's parliament of religions held in Chicago in 1893 and similar gatherings were held subsequently at intervals in Europe but the actual organisation was formed in 1936 by Sir Francis Younghusband and now an annual conference is held and educational activity carried on.

World Council of Churches, a union of Christian Churches from all over the world (including the Churches of the Protestant Anglican and Orthodox traditions, but excluding the Roman Catholic Church) engaged in extending Christian mission and unity throughout the world. All Churches which accept our Lord Jesus Christ as God and Saviour are eligible. This modern ecumenical movement stems from the great World Missionary Conference held at Edinburgh in 1910. The World Council was founded in 1948 and meets for consultation from time to time—the fourth assembly met at Uppsala in 1968 to discuss the theme All Things New.

Y

Yoga a Hindu discipline which teaches a technique for freeing the mind from attachment to the senses so that once freed the soul may become fused with the universal spirit (*Atman* or *Brahman*) which is its natural goal. This is the sole function of the psychological and physical exercises which the Yogi undertakes, although few ever reach the final stage of *Samadhi* or union with *Brahman* which is said to take place in eight levels of attainment. These are: (1) *Yama* which involves the extinction of desire and egotism and their replacement by charity and unselfishness. (2) *Niyama* during which certain rules of conduct must be adopted such as cleanliness the pursuit of devotional studies, and the carrying out of rituals of purification. (3) *Asana* or the attainment of correct posture and the reduction to a minimum of all bodily movement (the usual posture of the concentrating Yogi is the lotus position familiar from pictures). (4)–(5) *Pranayama* the right control of the life-force or breath in which there are two stages at which the practitioner hopes to arrive the first being complete absorption in the act of breathing which empties the mind of any other thought the second being the ability to cease to breathe which allegedly enables him to achieve marvellous feats of endurance. (6) *Pratyahara* or abstraction which means the mind's complete withdrawal from the world of sense. (7) *Dharana* in which an attempt is made to think of one thing only which finally becomes a repetition of the sacred syllable OM, and perhaps by a kind of self-hypnosis leads (8) to *Samadhi* the trance state which is a sign of the complete unity of soul with reality.

Yoga is very old and when the sage Patanjali (c. 300 B.C.) composed the book containing these instructions the *Yoga Sutra* he was probably collecting from many ancient traditions. Some of the claims made by Yogis seem to the Western mind frankly incredible but in the West and especially in recent years Yoga methods have been used at the lower levels in order to gain improved self-control, better posture, and improved health. Whether it achieves these ends is another matter but the genuine Yogi regards this as a perversion of the nature and purpose of the discipline.

Z

Zen Buddhism a Buddhist sect which is believed to have arisen in 6th cent. China but has flourished chiefly in Japan for some reason it has of recent years begun to attract attention in the West thanks to the voluminous writings of Dr D T Suzuki and the less numerous but doubtless much read books of Mr Christmas Humphreys. But the fact that these writings exist does not explain their being read nor why of all possible Eastern sects this particular one should be chosen in our times. What is Zen's attraction and why should anyone take the trouble to read about something (the word something is used for reasons that will become evident) that is not a religion has no doctrine knows no God and no after life no good and no evil and possesses no scriptures but has to be taught by parables which seem to be purposely meaningless? One of the heroes of Zen is the fierce looking Indian monk Bodhidharma (fl c 516-534) who brought Buddhism to China of whom it is recounted that when the Emperor asked him how much merit he had acquired by supporting the new creed the monk shouted at him 'None what ever! The Emperor then wished to know what was the sacred doctrine of the creed and again the monk shouted 'It is empty—there is nothing sacred! Dr Suzuki having affirmed that there is no God in Zen goes on to state that this does not mean that Zen denies the existence of God because neither denial nor affirmation concerns Zen. The most concrete statement he is prepared to make is that the basic idea of Zen is to come in touch with the inner workings of our being and to do this in the most direct way possible without resorting to anything external or superadded. Therefore anything that has the semblance of an external authority is rejected by Zen. Absolute faith is placed in a man's own inner being. Apparently the intention is that so far from indulging in inward meditations or such practices as the Yogi uses the student must learn to act spontaneously without thinking and without self consciousness or hesitation. This is the main purpose of the *koan* the logically insoluble riddle which the pupil must try to solve. One such is the question put by master to pupil 'A girl is walking down the street is she the younger or the older sister? The correct answer it seems is to say nothing but put on a minding gait to become the girl thus showing that what matters is the experience of being and not its verbal description. Another *koan* 'What is the Buddha? Three pounds of flax' is attributed to Tung shan in the 9th cent and a later authority's comment is that none can excel it as regards its irrationality which cuts off all passages to speculation. Zen in effect teaches the uselessness of trying to use words to discuss the Absolute.

Zen came to Japan in the 13th cent more than five centuries after Confucianism or the orthodox forms of Buddhism and immediately gained acceptance whilst becoming typically Japanese in the process. One of the reasons why it appealed must have been that its spontaneity and insistence on action without thought its emphasis on the uselessness of mere words and such categories as logical opposites had an inevitable attraction for a people given to seriousness formality and logic to a degree which was almost stifling. Zen must have been to the Japanese what nonsense rhymes and nonsense books like those of Edward Lear and Lewis Carroll were to the English intellectuals. Lear's Nonsense like some of the *koans* end up with a line which just at the time when one expects a point to be made has no particular point at all and *Alice in Wonderland* is the perfect example of a world not without logic but with a crazy logic of its own which has no relationship to that of everyday life. Therefore Zen began to impregnate every aspect of life in Japan and one of the results of its emphasis on spontaneous action rather than reason was its acceptance by the Samurai the ferocious warrior class in

such activities as swordsmanship archery Japanese wrestling and later Judo and the Kamikaze dive bombers. But much of Japanese art especially landscape gardening and flower arrangement was influenced similarly and Zen is even used in Japanese psychiatry. The very strict life of the Zen monks is based largely on doing things learning through experience the periods of meditation in the Zendo hall are punctuated by sharp slaps on the face administered by the abbot to those who are unsatisfactory pupils. Dr Suzuki denies that Zen is nihilistic but it is probably its appearance of nihilism and its appeal to the irrational and spontaneous which attracts the Western world at a time when to many the world seems without meaning and life over regimented. However it has influenced such various aspects of Western life as philosophy (Heidegger) psychiatry (Erich Fromm and Hubert Benoit) writing (Aldous Huxley) and painting (Die Zen Gruppe in Germany).

Zionism a belief in the need to establish an autonomous Jewish home in Palestine which in its modern form began with Theodor Herzl (1860-1904) a Hungarian journalist working in Vienna. Although Herzl was a more or less assimilated Jew he was forced by the Dreyfus case and the pogroms in Eastern Europe to conclude that there was no real safety for the Jewish people until they had a state of their own. The Jews of course had always in a religious sense thought of Palestine as a spiritual homeland and prayed next year in Jerusalem but the religious had thought of this in a philosophical way as affirming old loyalties not as recommending the formation of an actual state. Therefore Herzl was opposed both by many of the religious Jews and at the other extreme by those who felt themselves to be assimilated and in many cases without religious faith. Even after the Balfour Declaration of 1917 there was not a considerable flow of Jews to Palestine which at that time was a predominantly Arab state. But the persecutions of Hitler changed all this and after bitter struggles the Jewish state was proclaimed in 1948. Today Zionism is supported by the vast majority of the Jewish communities everywhere (although strongly disapproved of in the Soviet Union as Western imperialism) and Zionism is now an active international force concerned with protecting the welfare and extending the influence of Israel.

Zoroastrianism, at one time one of the great world religions competing in the 2nd cent AD on almost equal terms from its Persian home with Hellenism and the Roman Imperial Government. Under the Achaemenidae (c 550-330 BC) Zoroastrianism was the state religion of Persia. Alexander's conquest in 331 BC brought disruption but the religion flourished again under the Sassanian dynasty (AD 226-640). With the advance of the Mohammedan Arabs in the 7th cent Zoroastrianism finally gave way to Islam. A number of devotees fled to India there to become the Parsees. In Persia itself a few scattered societies remain. The name Zoroaster is the Greek rendering of Zarathustra, the prophet who came to purify the ancient religion of Persia. It is thought that he lived at the beginning of the 6th cent BC. He never claimed for himself divine powers but was given them by his followers. The basis of Zoroastrianism is the age long war between good and evil Ahura Mazda heading the good spirits and Anhriman the evil ones. Morality is very important since by doing right the worshipper is supporting Ahura Mazda against Anhriman and the evil doers will be punished in the last days when Ahura Mazda wins his inevitable victory.

The sacred book of this religion is the *Avesta*. If Zoroastrianism has little authority today it had a very considerable influence in the past. Its doctrines penetrated into Judaism (qv) and through Gnosticism Christianity. The worship of Mithra by the Romans was an impure version of Zoroastrianism. Manichaeism (qv) was a Zoroastrian heresy and the Albigensianism of medieval times was the last relic of a belief which had impressed itself deeply in the minds of men.

GAZETTEER OF THE WORLD

A complete index to the maps with
up-to-date descriptive matter, to-
gether with a list of Commonwealth
countries with their land areas and
recent estimates of population

GAZETTEER OF THE WORLD

An endeavour has been made to include all the more important places throughout the world. The small scale of the maps included in the Cyclopaedia does not enable all places included in the gazetteer to be named on the maps.

In regard to the spelling of place names the general principle followed has been to adopt national spellings. For those countries where the Latin Alphabet is not used the principles for transliteration laid down by the Permanent Committee on Geographical Names of the Royal Geographical Society have been followed. Chinese entries are in the conventional English form. New official Chinese forms based on Chinese romanised alphabet adopted 1958 is in brackets. There may be a few instances where the spelling shown on the map does not conform to that used in the gazetteer.

ABBREVIATIONS USED IN THE GAZETTEER

GEOGRAPHICAL NAMES

<i>Ala</i> = Alabama	<i>La</i> = Louisiana	<i>Pac Oc</i> = Pacific Ocean
<i>Ark</i> = Arkansas	<i>Mass</i> = Massachusetts	<i>Pa</i> = Pasadena
<i>ASSR</i> = Autonomous Soviet Socialist Republic	<i>Md</i> = Maryland	<i>Penns</i> = Pennsylvania
